# Introduction

KNIME Business Hub is a customer-managed Hub instance. Once you have a license for it and proceed with installation you will have access to Hub resources and will be able to customize specific features, as well as give access to these resources to your employees, organize them into Teams and give them the ability to manage specific resources.

This guide provides information on how to administrate a KNIME Business Hub instance.

To install a KNIME Business Hub please refer to the [KNIME Business Hub Installation Guide](#).

A user guide is also available [here](#), which contains instructions on how to perform team administration tasks. Team admins are designated by the global Hub admin, and have control over their team's allocated resources, can add users to their team, create execution contexts and have an overview of the team's deployments. In this way the Hub administration tasks are distributed and reallocated to those users that have a better overview of their own team necessities.

# Create and manage teams

A team is a group of users on KNIME Hub that work together on shared projects. Specific Hub resources can be owned by a team (e.g. spaces and the contained workflows, files, or components) so that the team members will have access to these resources.

Sign in to the KNIME Business Hub instance with the admin user name by visiting the KNIME Business Hub URL.

Then click your profile picture on the right upper corner of the page and select *Administration* to go to the KNIME Business Hub Administration page. Click *Teams* in the menu on the left. Here you will be able to see an overview of the existing teams and you will be able to manage them.

## Create a team

To create a new team click the yellow plus button on the right.

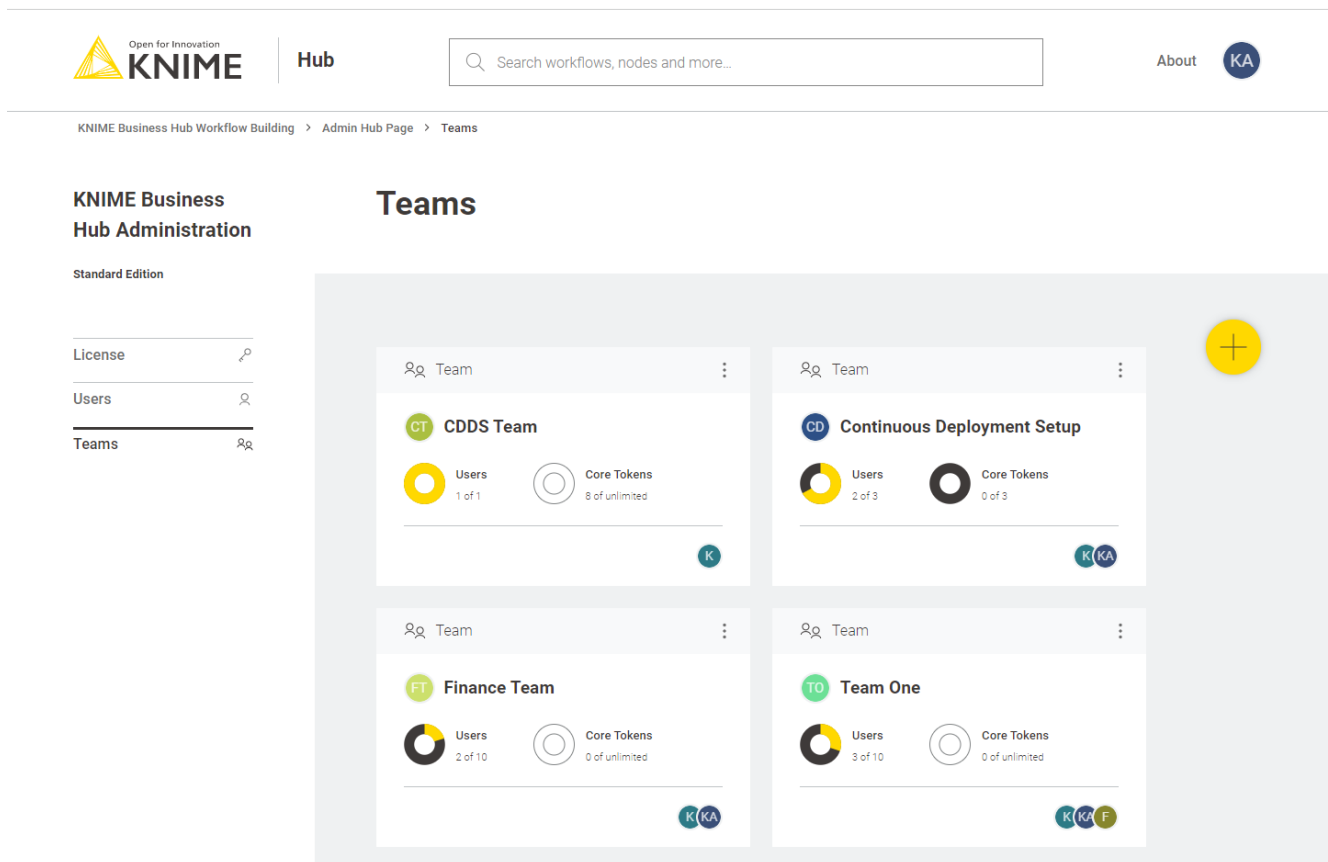

Figure 1. Create a new team in the KNIME Business Hub Administration page

After you create a new team you will be redirected to the new team's page. Here you can change the name of the team. To do so click the name of the team under the team logo on the left side of the page. The name of the team can also be changed at any point in time by

the team administrator.

From the team's page you can:

- Add members to the team
- Change their role to, for example, promote a user to team administrator role

Here you might for example want to assign the team to a team administrator. To do so click *Manage team* and enter the user name of the user you want to assign as a team administrator for the current team. Then click on the role and select *Member* and *Admin*. At the same time you might want to delete the global admin user name from the team members list. To do so click the bin icon corresponding to that user. Click *Save changes* to finalize the setting.

## Allocate resources to a team

To allocate resources to a team navigate to the KNIME Business Hub Administrator page and select *Teams* from the menu on the left.

Here you can see an overview of the teams available, their allocated resources, and of their current usage. Click the three dots on the right upper corner of the card corresponding to the team you want to allocate resources to.

Figure 2. Manage resources of a team

Select *Manage resources* from the menu. A panel on the right will open where you can select the resources you want to allocate.

Figure 3. Allocate resources to a team

Here you can change:

- The maximum number of members allowed in that team
- The maximum number of execution vCore tokens allowed for that team

Click *Save changes* when you have set up the resources for the current team.

## Manage team members

From the KNIME Business Hub Administration page you can also manage the team members.

Click the three dots on the right upper corner of the card corresponding to the team. From the menu that opens select *Manage members*. In the side panel that opens you can add members to a team, or change the team members role.

## Delete a team

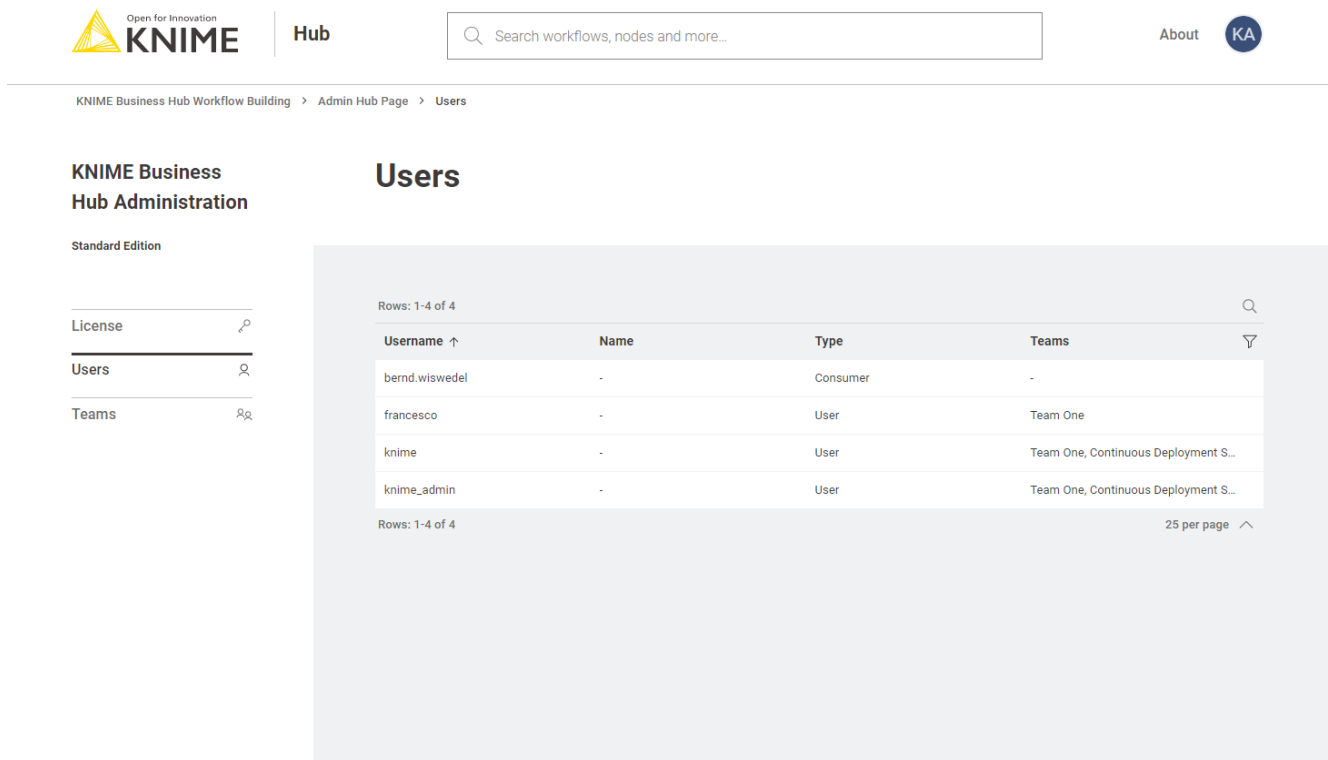

From the KNIME Business Hub Administration page you can also delete a team.

Click the three dots on the right upper corner of the card corresponding to the team. From the menu that opens select *Delete*. Be aware that this operation will delete also all the team resources, data and deployments.

# Users management

To see a list of all the users that have access to your KNIME Business Hub instance you can go to the KNIME Business Hub Administration page and select *Users* from the menu on the left.

The screenshot shows the KNIME Business Hub Administration interface. At the top, there is a search bar with the text "Search workflows, nodes and more...". Below the search bar, the breadcrumb navigation reads "KNIME Business Hub Workflow Building > Admin Hub Page > Users". On the left side, there is a navigation menu with options: "License", "Users", and "Teams". The main content area is titled "Users" and displays a table with the following data:

| Username ↑     | Name | Type     | Teams                                |
|----------------|------|----------|--------------------------------------|
| bernd.wiswedel | -    | Consumer | -                                    |
| francesco      | -    | User     | Team One                             |
| knime          | -    | User     | Team One, Continuous Deployment S... |
| knime_admin    | -    | User     | Team One, Continuous Deployment S... |

At the bottom of the table, it indicates "Rows: 1-4 of 4" and "25 per page".

Figure 4. Manage users on KNIME Business Hub Administration page

Here you can filter the users based on their team, the type of users and their username and name. To do so click the funnel icon in the users list. You can also search the users by using the magnifier icon and typing the keyword in the field that appears.

## Delete a user

You can delete a user from the KNIME Business Hub Administration page. Click the three dots and select *Delete*. You will need to confirm the user deletion in the window that opens by clicking *Delete user*. Be aware that this action will also delete all data from the deleted user and it will not be possible to restore the user.

Note that this user will continue to exist in Keycloak itself and you may want to delete it from there as well.

## Make a user Global Hub Admin

Users are managed in the backend via the Keycloak instance embedded in KNIME Business Hub. Therefore, the operation of promoting a registered user to the role of Global Hub Admin is done in Keycloak.

To do so follow these steps:

1. First you will need to access the keycloak admin console. To do so you will need the credentials that are stored in a kubernetes secret called `credential-knime-keycloak` in the `knime` namespace. To get the required credentials, you need to access the instance the Business Hub is running on and run the following command:

```
kubectl -n knime get secret credential-knime-keycloak -o yaml
```

This will return a file that contains the `ADMIN_PASSWORD` and the `ADMIN_USERNAME`. Please notice that they are both base64 encrypted. In order to get the decrypted username and password, you can run the following commands:

```
echo <ADMIN_PASSWORD> | base64 -d  
echo <ADMIN_USERNAME> | base64 -d
```

2. Then go to <http://auth.<base-url>/auth/> and login.
3. In the top left corner click the dropdown and select the "Knime" realm, if you are not there already.

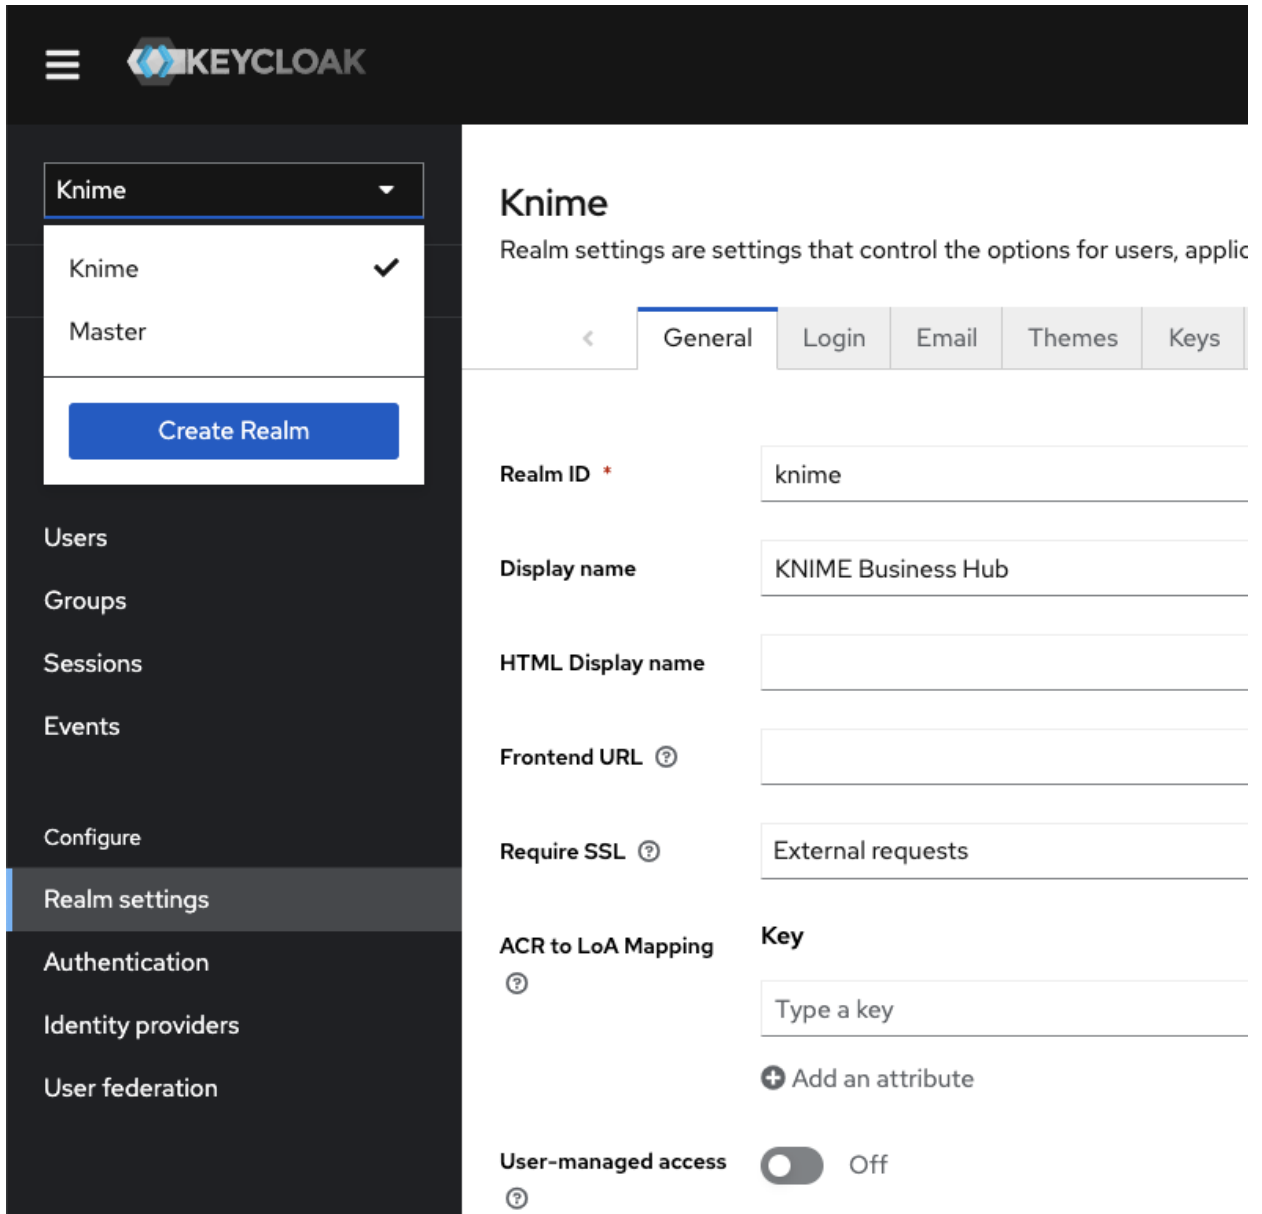

Figure 5. Select the "Knime" realm

4. Navigate to the *Users* menu and search for the user by name or email:

Figure 6. The Keycloak users menu

In order for a user to appear in this list, it is necessary that they have logged into your KNIME Business Hub installation at least once.

- Click the user and go to the *Groups* tab. Click *Join Group* and either expand the *hub* group by clicking it, or search for "admin". Select the admin group and click *Join*:

Figure 7. Making a user a Global Hub Admin in Keycloak. If you are searching for the group then the group might show up under its full path "/hub/admin"

6. Done. The user now has the role of Global Hub Admin, and can access the admin pages from within the Hub application to e.g., create teams or delete users.

Please notice that right now there are some operations that can be performed only by the global admin user that was created contextually to the KNIME Business Hub instance installation. Therefore, it is recommended to not delete the corresponding global admin user even when more users have been promoted to global admin users.

# Expose external groups inside KNIME Business Hub

As a Global KNIME Hub administrator you can configure groups that are provided via an external identity provider to be exposed inside the KNIME Business Hub instance.

Two possible sources for your external groups are:

1. Groups are provided within the access token of your OIDC provider.
2. Groups are imported from LDAP by federating the login.

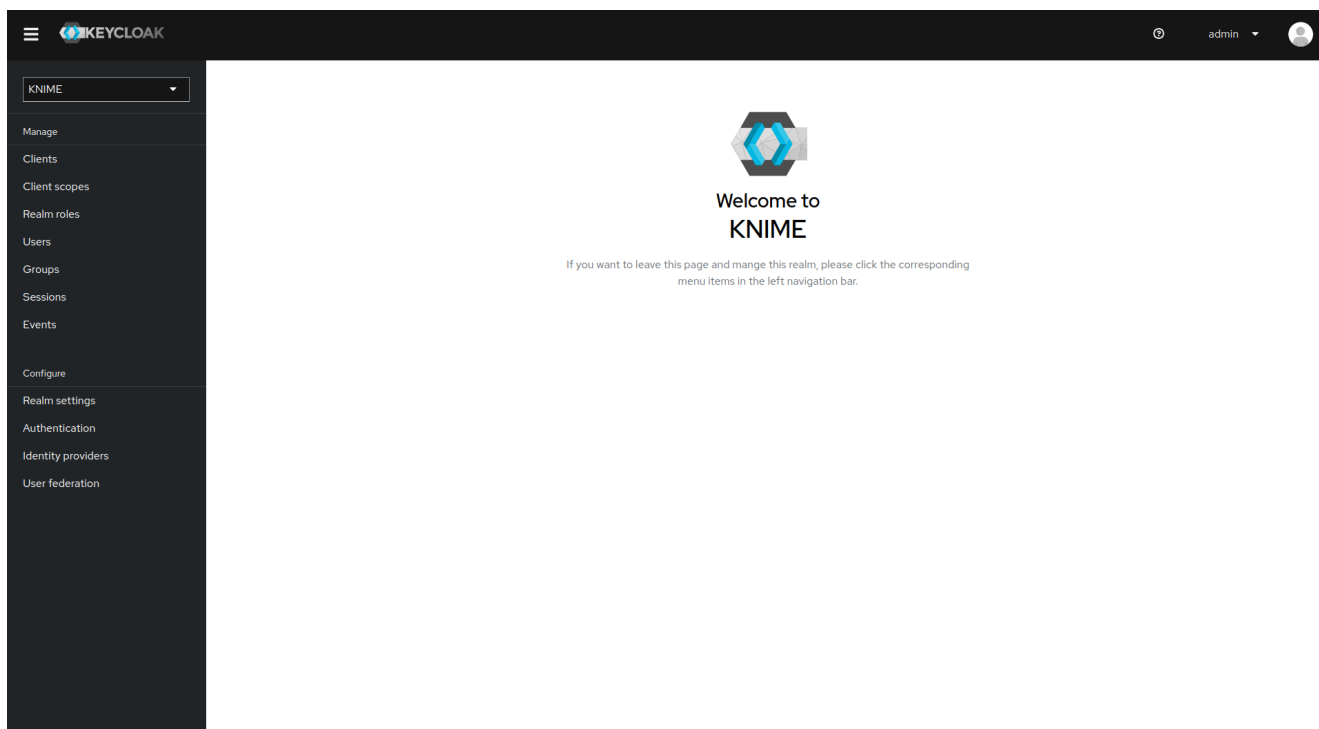

## External OIDC provider

Assume you have an identity provider that provides groups through a **groups** claim in the access token.

```
{
  ...,
  "groups": [
    "finance",
    "marketing",
    "data"
  ]
}
```

First you need to configure Keycloak in such a way that it can map these groups to a **user attribute**. The second step is to add a mapper that maps these user attributes into the Keycloak's tokens.

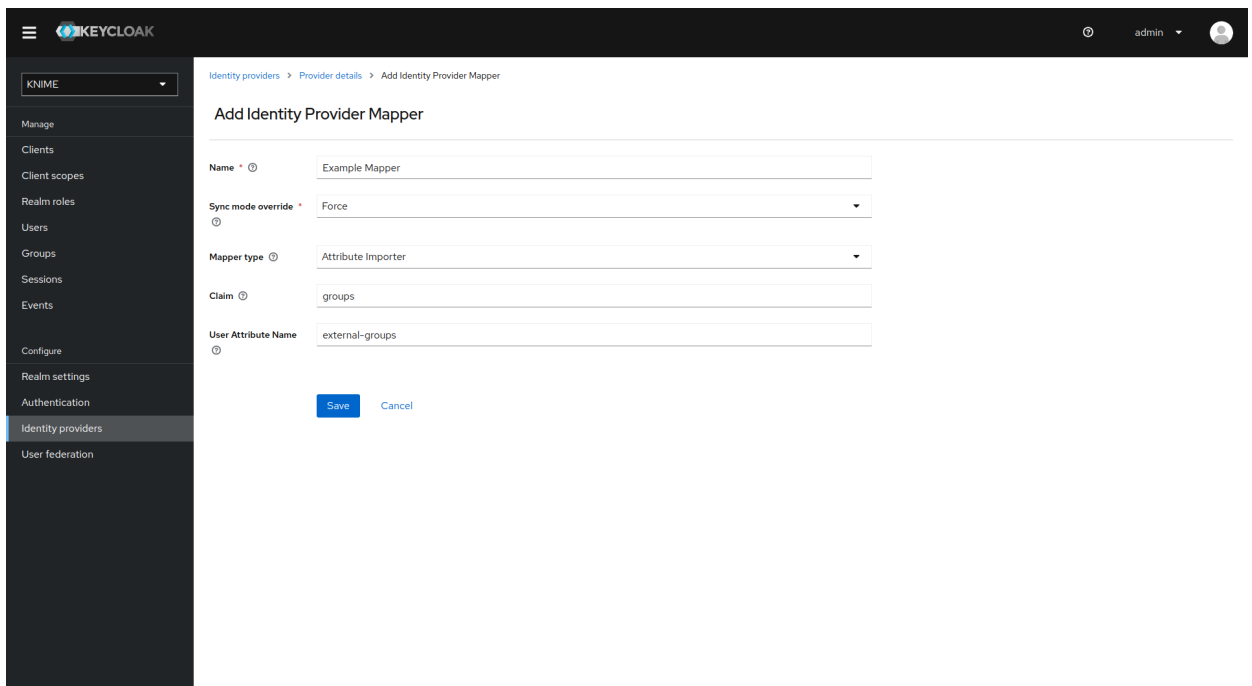

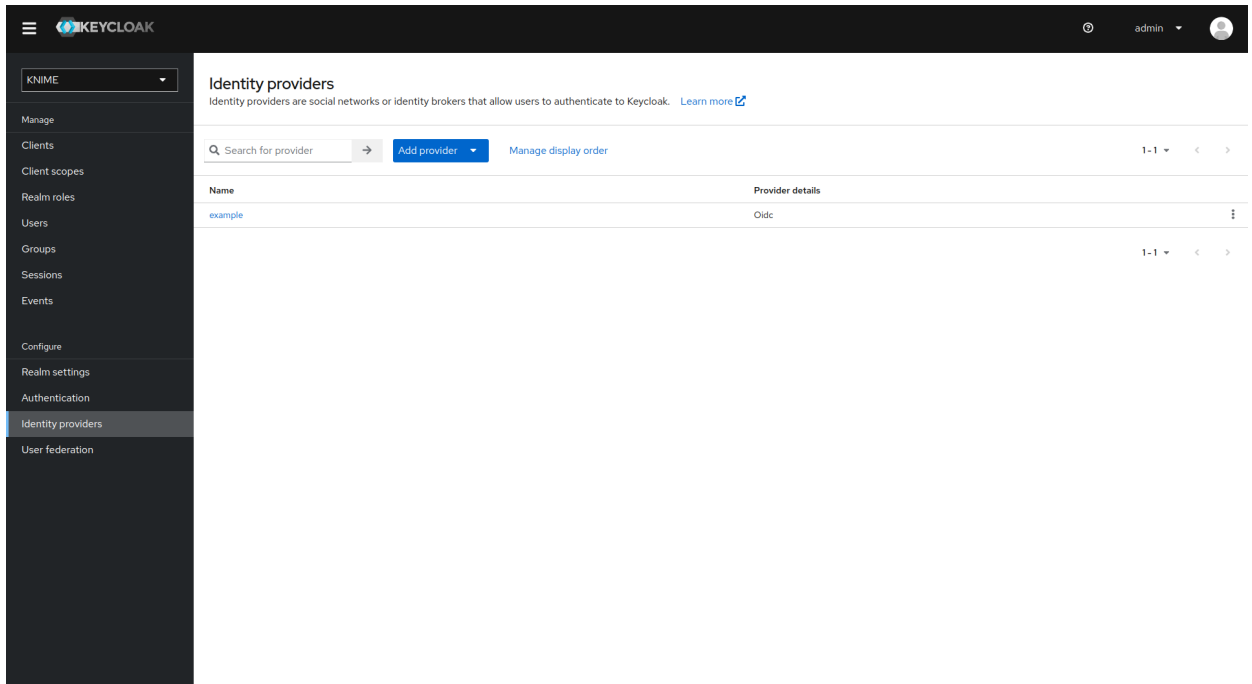

Your third-party identity provider should have been set up already. Keycloak has to be configured as follows:

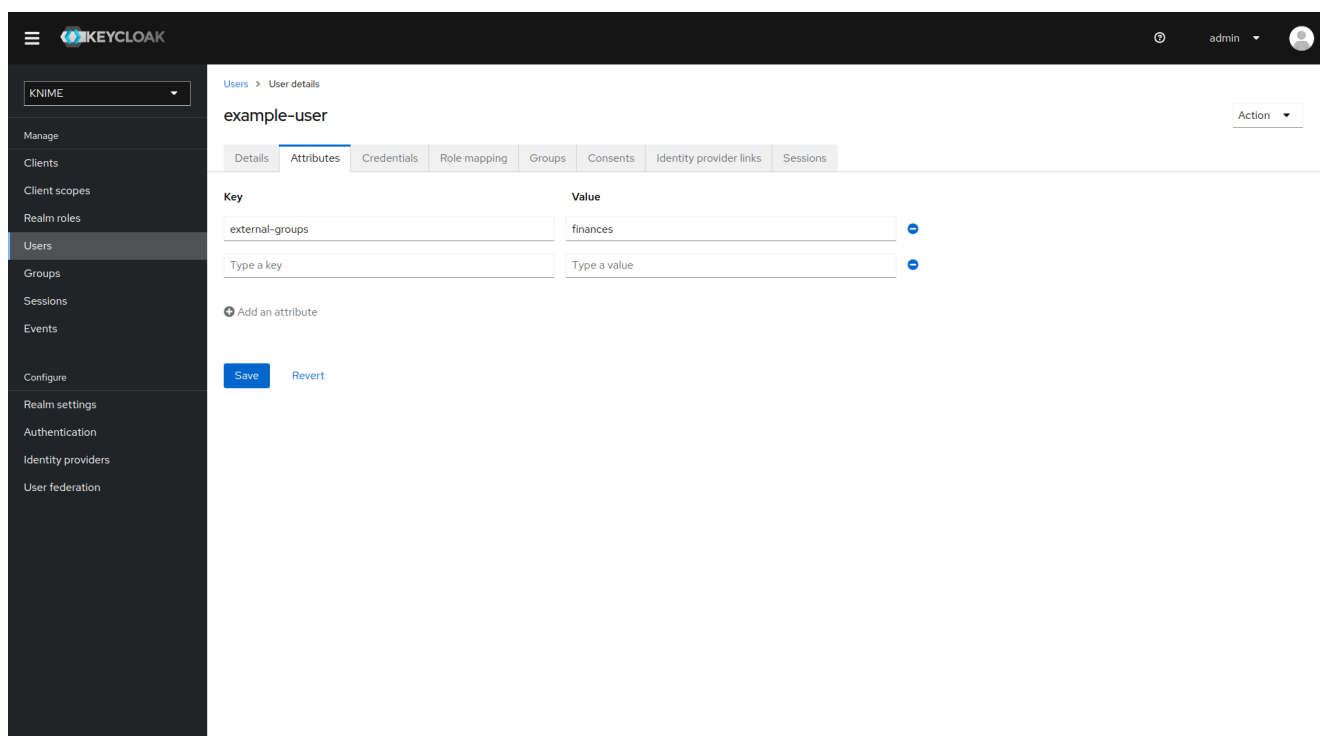

First step is to add an Attribute Importer Mapper.

1. In Keycloak select realm *Knime* in the top left dropdown menu
2. On the left tab select *Identity Providers*
3. Select your third-party provider
4. Switch to the tab *Mappers* and click on *Add mapper*
5. Provide a name for the mapper and set the *Sync mode override* to *Force* to ensure that the user's group memberships are updated upon every login
6. Set *Mapper type* to *Attribute importer*
7. Enter the *Claim* that contains the external groups in the original token (in our example *groups*)
8. In the *User Attribute Name* field enter *external-groups*
9. Click on *Save*

Now, every user in Keycloak who logged in after the mapper has been added will have an *external-groups* attribute associated like in the following picture:

Now, the external groups are known to Keycloak. To expose them inside KNIME Business Hub they need to be mapped into the access tokens issued by Keycloak. For this a second mapper needs to be added, that maps the user attribute *external-groups* to a claim in the user's access token.

To do this you need to add a client scope, which includes a mapper for the user attribute.

1. On the left tab select *Client scopes*
2. Select *groups*
3. Switch to the tab *Mappers*
4. Click on *Add mapper > By configuration* and select *User Attribute* from the list
5. Provide a name, e.g. *external-groups-attribute-mapper*
6. Set both fields *User Attribute* and *Token Claim Name* to *external-groups*
7. Ensure that *Add to ID token*, *Add to access token*, *Add to userinfo*, and *Multivalued* are turned on and that *Aggregate attribute values* is turned off
8. Click on *Save*

**Client scopes**  
Client scopes are a common set of protocol mappers and roles that are shared between multiple clients. [Learn more](#)

Search for client scope → [Create client scope](#) Change type to

| Name                  | Assigned type | Protocol       | Display order | Description  |
|-----------------------|---------------|----------------|---------------|--|
| acr                   | Default       | OpenID Connect | -             | OpenID Connect scope for add acr (authentication context class reference) to the token |
| address               | Optional      | OpenID Connect | -             | OpenID Connect built-in scope: address   |
| email                 | Default       | OpenID Connect | -             | OpenID Connect built-in scope: email   |
| external-groups-scope | Default       | OpenID Connect | -             | scope for external groups  |
| groups                | None          | OpenID Connect | -             | -  |
| microprofile-jwt      | Optional      | OpenID Connect | -             | Microprofile - JWT built-in scope  |
| offline_access        | Optional      | OpenID Connect | -             | OpenID Connect built-in scope: offline_access  |
| phone                 | Optional      | OpenID Connect | -             | OpenID Connect built-in scope: phone   |
| profile               | Default       | OpenID Connect | -             | OpenID Connect built-in scope: profile   |
| role_list             | Default       | SAML           | -             | SAML role list   |

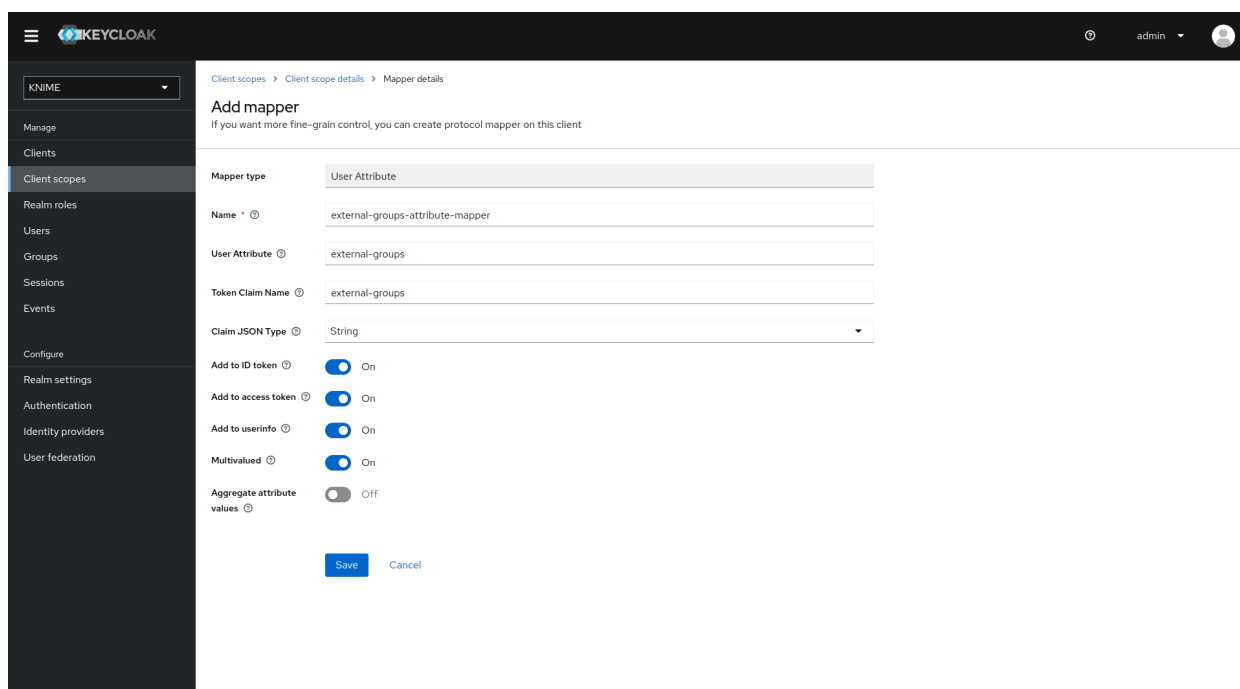

Client scopes > Client scope details

**Groups** [openid-connect](#) Action

Settings Mappers Scope

Search for mapper → [Add mapper](#)

| Name   | Category     | Type            | Priority |
|--------|--------------|-----------------|----------|
| groups | Token mapper | User Realm Role | 40       |

With both mappers in place, the external groups are part of the access tokens issued by Keycloak. By this, the external groups are exposed inside KNIME Business Hub. In order to enable external groups to be used for permissions and access management they need to be configured separately through the admin REST API as described in [Enable external groups](#).

## LDAP federation

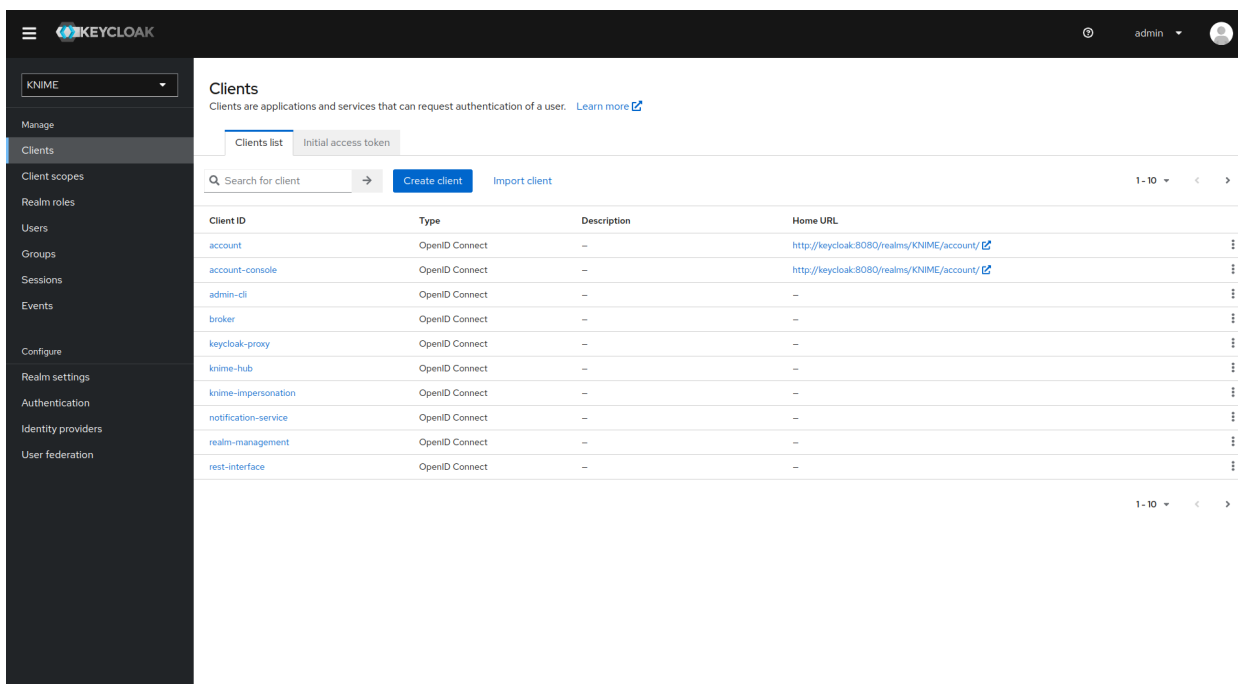

If you have user federation configured for an LDAP instance that also supplies external group names you need to configure mappers that map these groups into the access tokens used inside the Hub instance.

To ensure that groups from Keycloak groups and groups from LDAP are not mixed we recommend to treat external groups as realm roles.

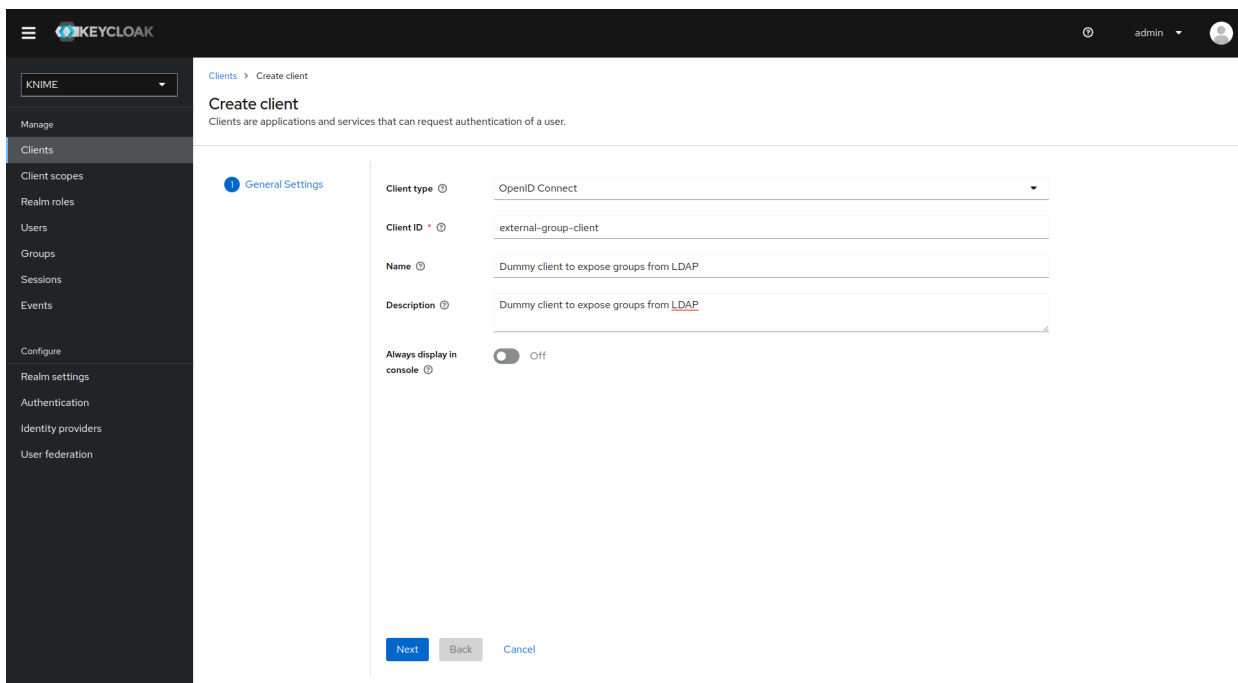

In order to do this we recommend to first create a dummy client for which roles can be created based on the LDAP groups. This will guarantee that any changes will be compatible with future changes to the KNIME Hub client in Keycloak.

To create a new client follow these steps:

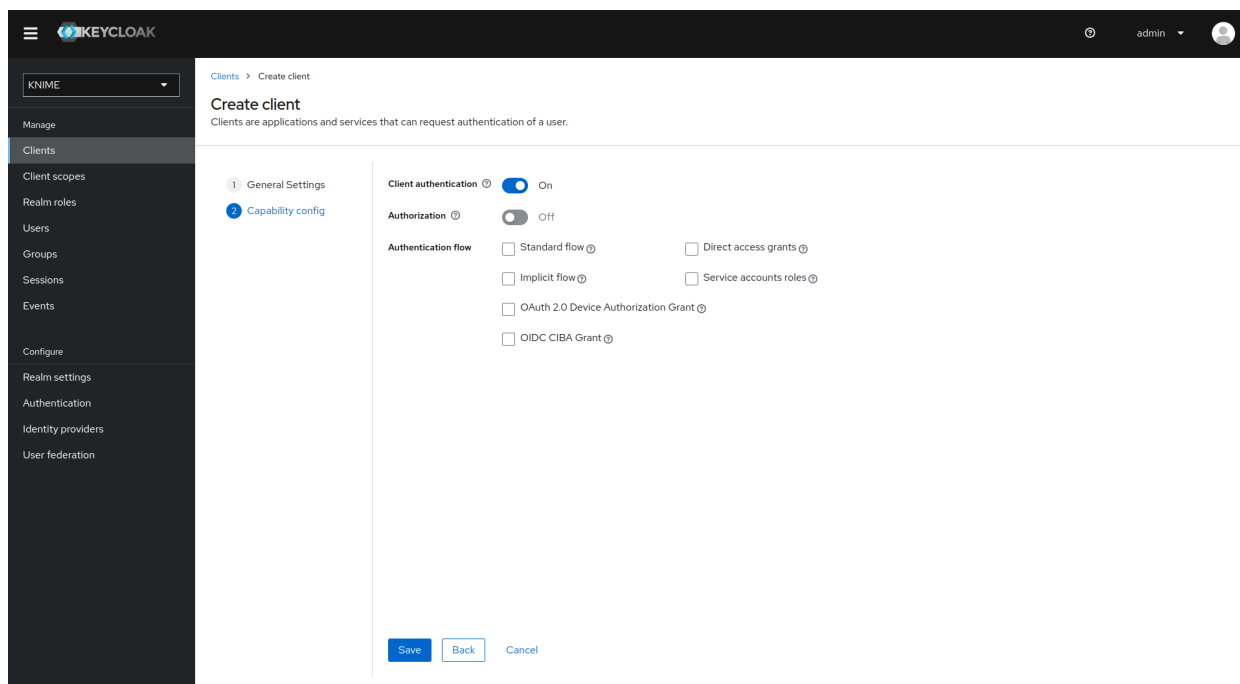

1. In Keycloak select realm *Knime* in the top left dropdown menu
2. On the left tab select *Clients* and click *Create client*

3. Set *Client type* to *OpenID Connect*
4. Enter a *Client ID* (in our example *external-group-client*), and a useful *Name* and *Description*
5. Click on *Next*

6. De-select all checkboxes of *Authentication flow* in the *Capability config* section, since this client will not require any capabilities
7. Enable *Client authentication*
8. Click on *Save*

Now that the dummy client is set up, you can proceed to create a mapper that maps the user groups from LDAP to roles inside the dummy client:

1. On the left tab select *User federation* and click on your LDAP configuration
2. Switch to the tab *Mappers*
3. Click on *Add mapper*
4. Provide a name, e.g. *ldap-group-to-dummy-client-role-mapper*
5. Set *Mapper type* to *role-ldap-mapper*
6. Setup the mapper according to your LDAP
7. Disable *User Realm Roles Mapping*
8. Set *Client ID* to the previously created dummy client (in our example *external-group\_client*)
9. Click on *Save*

The screenshot shows the Keycloak Admin Console interface. The left sidebar is dark with a menu for 'KNIME' and various management options. The main content area is titled 'Create new mapper' and contains a form with the following fields:

- Name: ldap-group-to-dummy-client-role-mapper
- Mapper type: role-ldap-mapper
- LDAP Roles DN: OU=groups,DC=knime,DC=com
- Role Name LDAP Attribute: CN
- Role Object Classes: groupOfNames
- Membership LDAP Attribute: member
- Membership Attribute Type: DN
- Membership User LDAP Attribute: CN
- LDAP Filter: (empty)
- Mode: READ\_ONLY
- User Roles Retrieve Strategy: LOAD\_ROLES\_BY\_MEMBER\_ATTRIBUTE
- Member-Of LDAP Attribute: memberOf
- Use Realm Roles Mapping: Off
- Client ID: external-group-client

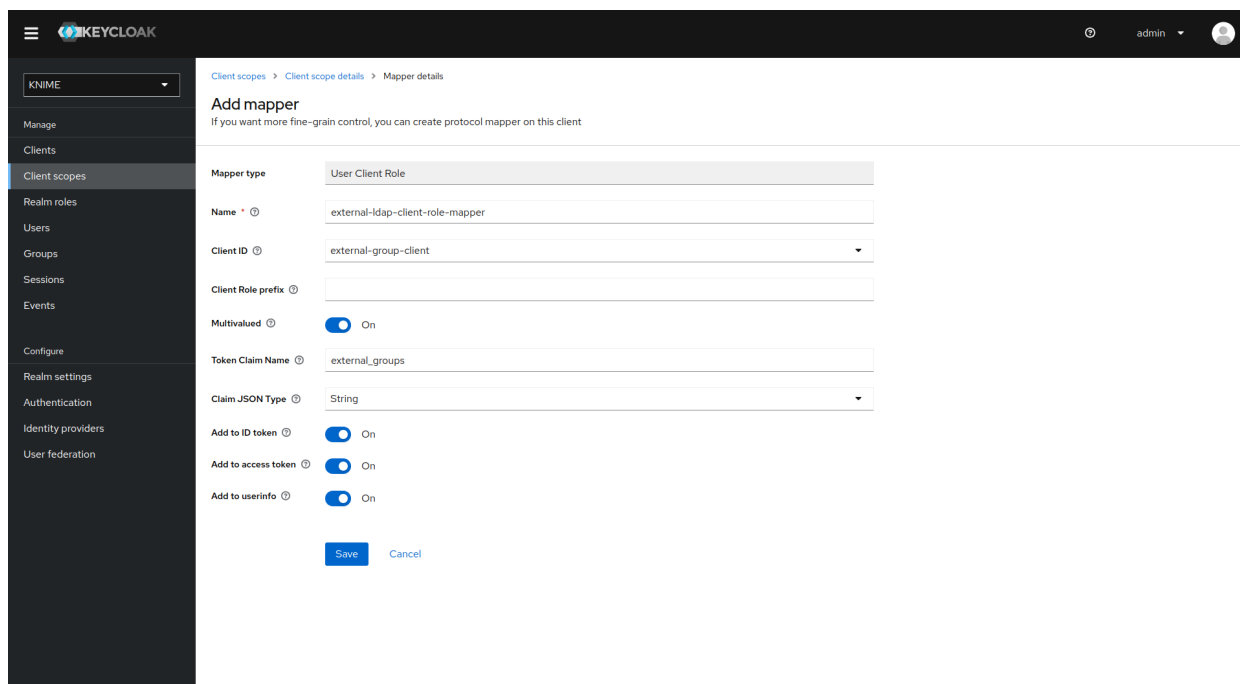

At the bottom of the form are 'Save' and 'Cancel' buttons.

Now if a user logs in with the LDAP credentials the user's groups will be mapped to ad-hoc created client roles inside the 'external-group-client'.

Next, you need to create a mapper that maps a user's realm roles from the dummy realm to the access tokens:

1. On the left tab select *Client scopes*
2. Select *groups*
3. Switch to the tab *Mappers*
4. Click on *Add mapper > By configuration* and select *User Client Role* from the list
5. Provide a name, e.g. *external-ldap-client-role-mapper*
6. Set *Client ID* to the previously created dummy client (in our example *external-group\_client*)
7. Set *Token Claim Name* to *external-groups*
8. Set *Claim JSON Type* to *String*
9. Ensure that *Add to ID token*, *Add to access token*, *Add to userinfo*, and *Multivalued* are turned on

## 10. Click on Save

## Enable external groups

Once you have configured the external groups in Keycloak you need to create the the groups that you want to be available inside KNIME Business Hub.

To do so you have to make a PUT request to the corresponding endpoint:

```
PUT https://api.<base-url>/accounts/hub:global/groups/<external-group-name>
```

where <external-group-name> is the name of the group and it must match the group name in the external identity provider.

You can use the following JSON type body in order to set a display name for the group to be shown on KNIME Business Hub.

```
{
  "displayName": "My Group Display Name"
}
```

# Docker executor images

In order to create execution contexts for their teams, team admins will need to reference the Docker image of the KNIME Executor that they want to use.

Public Docker executor images are made available by KNIME which correspond to the full builds of KNIME Executor versions 4.7.0 and higher.

The currently available executor images have the following docker image name:

- `registry.hub.knime.com/knime/knime-full:r-4.7.4-179`
- `registry.hub.knime.com/knime/knime-full:r-4.7.5-199`
- `registry.hub.knime.com/knime/knime-full:r-4.7.6-209`
- `registry.hub.knime.com/knime/knime-full:r-4.7.7-221`
- `registry.hub.knime.com/knime/knime-full:r-4.7.8-231`
- `registry.hub.knime.com/knime/knime-full:r-5.1.0-251`
- `registry.hub.knime.com/knime/knime-full:r-5.1.1-379`
- `registry.hub.knime.com/knime/knime-full:r-5.1.2-433`
- `registry.hub.knime.com/knime/knime-full:r-5.1.3-594`
- `registry.hub.knime.com/knime/knime-full:r-5.2.0-271`
- `registry.hub.knime.com/knime/knime-full:r-5.2.1-369`
- `registry.hub.knime.com/knime/knime-full:r-5.2.2-445`
- `registry.hub.knime.com/knime/knime-full:r-5.2.3-477`

However you might want to add specific extensions to the KNIME Executor image that is made available to team admins to create execution contexts.

The following section explains how to do so.

## Add extensions to an existing Docker image

In order to install additional extensions and features to the KNIME Executor image, you will need to first create a `Dockerfile`. The file is named `Dockerfile` with no file extension. You can use the example `Dockerfile` below which demonstrates how to extend the base image with a custom set of update sites and features.

If you need to install Docker please make sure not to install it on the same virtual machine (VM) where the KNIME Business Hub instance is installed, as it might interfere with `containerd`, which is the container runtime used by Kubernetes.

```
# Define the base image
FROM registry.hub.knime.com/knime/knime-full:r-4.7.4-179

# Define the list of update sites and features
# Optional, the default is the KNIME Analytics Platform update site (first entry in the
list below)
ENV KNIME_UPDATE_SITES=https://update.knime.com/analytics-
platform/4.7,https://update.knime.com/community-contributions/trusted/4.7
# Install a feature from the Community Trusted update site
ENV KNIME_FEATURES="org.knime.features.geospatial.feature.group"

# Execute extension installation script
RUN ./install-extensions.sh
```

The `KNIME_UPDATE_SITES` environment variable determines the update sites that will be used for installing KNIME Features. It accepts a comma-delimited list of URLs. The `KNIME_FEATURES` environment variable determines the extensions which will be installed in the KNIME Executor. It accepts a comma-delimited list of feature group identifiers. A corresponding update site must be defined in the `KNIME_UPDATE_SITES` list for feature groups to be successfully installed. You can get the necessary identifiers by looking at *Help* → *About KNIME* → *Installation Details* → *Installed Software* in a KNIME instance that has the desired features installed. Take the identifiers from the "Id" column and make sure you do not omit the `.feature.group` at the end (see also screenshot on the next page). The base image contains a shell script `install-extensions.sh` which lets you easily install additional extensions in another Dockerfile.

Once the Dockerfile has been customized appropriately, you can build a Docker image from it by using the following command:

```
# Replace <image_name> and <tag_name> with actual values
docker build -t <image_name>:<tag_name> .
```

## Python and Conda in Docker images

When you create an Execution Context on KNIME Business Hub based on a **full build** you will have KNIME Python bundled available. If you need additional libraries you would need to make them available on the Hub instance.

You can do this in two ways:

1. Use the Conda Environment Propagation node.
2. Customize the Executor image used.

To get started with Conda environment propagation, check out [KNIME Python Integration Guide](#). However, any libraries installed using Conda environment propagation will be removed when the executor restarts and installed again next time, so libraries that are used often should be installed as part of the executor Docker image.

In order to do so you need to:

1. Install Python in the executor Docker image
2. Declare to the execution context the path to the Python installation folder so that the executor can execute Python nodes

## Install Python in the executor Docker image

The first step is the installation of Python and an environment manager for instance miniconda on a Docker image.

To do so, first you need the Docker Project to hold a miniconda installer near the Dockerfile, for example:

```
python-image/  
  container/  
    |-Miniconda3-py310_23.3.1-0-Linux-x86_64.sh  
  dockerfiles/  
    |-Dockerfile
```

You will also need to provide a `.yaml` file that will contain all the modules, packages and Python version that you need to install in order to execute the Python scripting nodes.

The `.yaml` file could look like the following:

```

name: py3_knime # Name of the created environment
channels: # Repositories to search for packages
  - defaults
  - anaconda
  - conda-forge
dependencies: # List of packages that should be installed
# - <package>=<version> # This is an example of package entry structure
  - python=3.6 # Python
  - scipy=1.1 # Notebook support
  - numpy=1.16.1 # N-dimensional arrays
  - matplotlib=3.0 # Plotting
  - pyarrow=0.11 # Arrow serialization
  - pandas=0.23 # Table data structures

```

Then you need to pull any **available executor Docker image**, install miniconda in batch mode on the image and define the environment variable for conda, as in the following example. Also you will need to create your environments, that you specified in the `.yaml` files.

```

# getting recent knime-full image as a basis
FROM registry.hub.knime.com/knime/knime-full:r-4.7.3-160

# getting Miniconda and install in batch mode
COPY container/Miniconda3-py310_23.3.1-0-Linux-x86_64.sh /home/knime/miniconda-latest.sh
RUN bash miniconda-latest.sh -b

# adding path to Miniconda bin folder to system PATH variable
ENV PATH="/home/knime/miniconda3/bin:$PATH"

# copy default conda environments into container
COPY --chown=knime envs/ ./temp_envs
RUN conda env create -f ./temp_envs/py3_knime.yaml && \
  rm -rf ./temp_envs

```

When installing conda and creating the environments you will obtain the following paths that will need to be added in the `.epf` file of the customization profile during the **set up of the execution context**.

For example based on the above Dockerfile:

```

<path to conda installation dir>=/home/knime/miniconda3/
<path to default conda environment dir>=<path to conda installation dir>/envs/<name of the env>

```

Now you can build the new Docker image, for example:

```
docker build . -f /dockerfiles/Dockerfile -t knime-full:4.7.3-with-python
```

Finally retag the image to make it useable for your embedded registry on Business Hub:

```
docker tag knime-full:4.7.3-with-python registry.<hub-url>/knime-full:4.7.3-with-python
```

Once you have created the Docker image with Python installed [create an execution context](#) that uses the newly created Docker image.

## Set up the execution context

Now you need to set up and customize the execution context.

In order to declare to the execution context the path to the Python installation you will need to build a dedicated [customization profile](#) and apply it to the execution context.

1. Build the `.epf` file by following the steps in [KNIME Python Integration Guide](#) and exporting the `.epf` file. To export the `.epf` file from KNIME Analytics Platform go to *File > Export Preferences...*
2. Open the file and use only the parts related to Python/conda.

The `.epf` file could look like the following:

```
/instance/org.knime.conda/condaDirectoryPath=<path to conda installation dir>  
/instance/org.knime.python3.scripting.nodes/pythonEnvironmentType=conda  
/instance/org.knime.python3.scripting.nodes/python2CondaEnvironmentDirectoryPath=<path  
to default conda environment dir>  
/instance/org.knime.python3.scripting.nodes/python3CondaEnvironmentDirectoryPath=<path  
to default conda environment dir>
```

Find more details on how to set-up the `.epf` file in the [Executor configuration](#) section of the [KNIME Python Integration Guide](#).

Now follow these steps to customize the execution context:

1. Build the `.zip` file containing the [customization profile](#) using the `.epf` file you just created.
2. Upload the [customization profile](#) `.zip` file to KNIME Business Hub.
3. Apply the [customization profile](#) to the execution context.

# Advanced configuration

This section covers some of the configuration settings that are available for your KNIME Business Hub instance.

The following configurations are available in the KOTS Admin Console and can be changed after the installation and first minimal configuration steps are concluded successfully.

You can access the KOTS Admin Console via the **URL and password** you are provided in the output upon installation.

## Configure networking

In the "Networking" section of the KOTS Admin Console you can:

- Deploy an external load balancer for traffic ingress: this feature takes effect only if your cloud provider and kubernetes distribution support automatic load balancer provisioning.
- Enable Transport Layer Security (TLS): the encryption protocol that provides communications security is highly recommended especially for KNIME Business Hub instances deployed in a production environment.
- Enable advanced ingress configuration: you can customize the ingress proxy behavior, for example configuring the read/send/connect timeouts.

### Networking

Configuration for external load balancer and TLS.

**Deploy Load Balancer**

Deploy an external load balancer. Your cloud provider and kubernetes distribution (e.g., AWS EKS or Azure AKS) must support automatic load balancer provisioning in order for this feature to take effect. See [kubernetes documentation](#) for more.

**Enable TLS** Recommended

Enable Transport Layer Security (TLS). This option is highly recommended for any KNIME Business Hub deployed in a production environment. A certificate must be created for all URLs configured above, including a wildcard certificate for `hub.example.com` and `*.hub.example.com`.

**Enable Advanced Ingress Configuration**

Customize the ingress proxy behavior such as read/send/connect timeouts. Changes to these settings require a restart of the `ingress-nginx-controller` pod before taking effect.

## Configure TLS

If you enable the Transport Layer Security (TLS) you need to have a certificate that is valid for all the **URLs defined during the installation**. We recommend to create a wildcard certificate for `<base-url>` and `*.<base-url>`, e.g. `hub.example.com` and `*.hub.example.com`.

Check *Enable TLS* in the "Networking" section of the KOTS Admin Console.

- **Provide your own certificate:** Select *Provide your own certificate* to be able to upload the certificate files.

You will need an unencrypted private key file and a certificate file that contains the full certificate chain. In the certificate chain the server certificate needs to be the first in the PEM file, followed by the intermediate certificate(s). You usually can get a certificate from your company's IT department or Certificate Authority (CA).

Another possibility, if you have a public domain name, is to use letsencrypt to obtain a certificate.

Both certificates need to be PEM formatted as requested by the `ingress-nginx-controller` (see the relevant documentation [here](#)).

## Networking

Configuration for external load balancer and TLS.

**Deploy Load Balancer**

Deploy an external load balancer. Your cloud provider and kubernetes distribution (e.g., AWS EKS or Azure AKS) must support automatic load balancer provisioning in order for this feature to take effect. See [kubernetes documentation](#) for more.

**Enable TLS** Recommended

Enable Transport Layer Security (TLS). This option is highly recommended for any KNIME Business Hub deployed in a production environment. A certificate must be created for all URLs configured above, including a wildcard certificate for `hub.example.com` and `*.hub.example.com`.

**Certificate Authority**

Select the TLS certificate authority to use for KNIME Business Hub.

Provide your own certificate     AWS ACM Certificate

**Private Key File**

The private key file should be pem formatted.

Upload a file

Browse files for Private Key File

**Certificate File**

The certificate file should be the full certificate chain in pem format.

Upload a file

Browse files for Certificate File

**Enable Advanced Ingress Configuration**

Customize the ingress proxy behavior such as read/send/connect timeouts. Changes to these settings require a restart of the `ingress-nginx-controller` pod before taking effect.

- Select *AWS ACM Certificate* if, instead, you have deployed an AWS Elastic Load Balancer (ELB). In this case you can use AWS Certificate Manager (ACM) and set the certificate as an annotation directly on the loadbalancer. You can find more information in AWS documentation for ACM [here](#).

Once you obtained the certificate Amazon Resource Name (ARN) in the form `arn:aws:acm:<region>:<account-id>:certificate/<certificate-id>`, insert the ARN in the corresponding field as shown in the image below.

## Networking

Configuration for external load balancer and TLS.

### Deploy Load Balancer

Deploy an external load balancer. Your cloud provider and kubernetes distribution (e.g., AWS EKS or Azure AKS) must support automatic load balancer provisioning in order for this feature to take effect. See [kubernetes documentation](#) for more.

### Enable TLS Recommended

Enable Transport Layer Security (TLS). This option is highly recommended for any KNIME Business Hub deployed in a production environment. A certificate must be created for all URLs configured above, including a wildcard certificate for `hub.example.com` and `*.hub.example.com`.

### Certificate Authority

Select the TLS certificate authority to use for KNIME Business Hub.

Provide your own certificate     AWS ACM Certificate

### AWS Certificate Manager ARN

When deploying in an existing AWS EKS cluster, and selecting the loadbalancer option above, you can attach a certificate from the AWS Certificate Manager to the loadbalancer here. Set the certificate ARN below in the format: `arn:aws:acm:<region>:<account-id>:certificate/<certificate-id>`

### Enable Advanced Ingress Configuration

Customize the ingress proxy behavior such as read/send/connect timeouts. Changes to these settings require a restart of the `ingress-nginx-controller` pod before taking effect.

## Configure Browser Security

In the "Browser Security" section of the KOTS Admin Console you can:

- Specify a custom Content Security Policy for Data App execution. It may be necessary to override the default if you are using custom JavaScript views that load external resources. The default works for all standard KNIME views. For more information about how to write the CSP statement, please refer to this [resource](#).
- Configure the X-Frame-Options header being set by webapps. This header is used to avoid click-jacking attacks, by ensuring that the sites content is not embedded into other sites. See [here](#) for more information.

## Browser Security

This section contains settings for browser security.

**Enable Content Security Policy for Data Apps**

Enabling this option allows you to set a custom Content Security Policy for Data Apps below. If disabled, no Content Security Policy header is set.

### Content Security Policy for Data Apps

Specifies a custom Content Security Policy for Data App execution. It may be necessary to override the default if you are using BIRT report generators or custom JavaScript views that load external resources. The default works for all standard KNIME views. For more information about how to write the CSP statement, please refer to this [resource](#).

```
default-src 'self'; script-src 'unsafe-inline' 'unsafe-eval' 'self'; style-src 'unsafe-inline' 'self'; img-src 'self' data:; font-src 'self'
```

Default value: `default-src 'self'; script-src 'unsafe-inline' 'unsafe-eval' 'self'; style-src 'unsafe-inline' 'self'; img-src 'self' data:; font-src 'self' data;`

### X-Frame-Options Header

Sets the `X-Frame-Options` header to the selected option, or doesn't set the header if `none` is selected. This header is used to avoid click-jacking attacks, by ensuring that the sites content is not embedded into other sites. See [here](#) for more information.

SAMEORIGIN    DENY    none

# Create a collection

It is possible to create collections on your KNIME Business Hub instance.

KNIME Collections on KNIME Hub allow upskilling users by providing selected workflows, nodes, and links about a specific, common topic.

One example of a collection can be found on KNIME Community Hub [here](#).

This is a feature of KNIME Business Hub - Enterprise edition.

In order to create a new collection page you need to be a Global Admin of your KNIME Business Hub instance.

The creation of a collection is possible via REST API, and a description of the different configurations can be found in your KNIME Business Hub API doc at the following URL:

```
api.<base-url>/api-doc/?service=catalog-service#/Collections
```

e.g. `api.hub.example.com/api-doc/?service=catalog-service#/Collections`.

In order to create a collection the items (i.e. workflows and nodes) that are collected need to be stored and accessible on the same KNIME Business Hub instance where collection is created.

To create the collection you will need then to build a json file with the schema that is available in the API doc in the Collections section, under the `POST /collections` request description.

The following is an example that would allow you to build a collection, similar to the one available on KNIME Community Hub [here](#).

In the first section you can for example set up a title, a description, a so-called hero, which is the banner image at the top right of the example collection page, and tags:

```
{
  "title": "Spreadsheet Automation",
  "description": "On this page you will find everything to get started with spreadsheet
automation in KNIME",
  "ownerAccountId": "account:user:<global-admin-user-id>",
  "hero": {
    "title": "New to KNIME?",
    "description": "Get started with <strong>KNIME Analytics Platform</strong> to import
all the examples and nodes you need for spreadsheet automation right now!",
    "actionTitle": "Download",
    "actionLink": "http://download-me-quick.999.com"
  },
  "tags": [
    "Excel",
    "XLS"
  ],
}
```

Next you can add different sections and subsections, each with a title and a description, choose a layout, and select the `itemType` such as *Space*, *Component*, *Workflow*, *Node*, *Extension*, or *Collection*. For each of these items you will need to provide the `id` under which they are registered in your Business Hub installation.

The `id` for workflows, spaces, components, and collections can be build by taking the last part of their URL, after the `~`, and adding a `*` at the beginning. For example, the following workflow on the KNIME Community Hub has URL <https://hub.knime.com/-/spaces/-/latest/~1DCip3Jbxp7BWz0f/> so its `id` would be `*1DCip3Jbxp7BWz0f`. The `id` for node and extensions instead needs to be retrieved with a REST call, for example to the search endpoint of your KNIME Business Hub instance.

```
"sections": [
  {
    "title": "Workflow examples",
    "description": "Some subtitle text here. Can have <strong>bold format</strong>",
    "iconType": "Workflow",
    "subsections": [
      {
        "title": "How to do basic spreadsheet tasks in KNIME",
        "description": "Some examples on how to do common things",
        "layout": "SingleColumn",
        "numberOfTeaseredItems": 2,
        "items": [
          {
            "title": "Click Here!",
            "itemType": "Link",
            "absoluteUrl": "https://knime.com"
          },
          {
            "id": "*SJW5zSkh1R3T-DB5",
            "itemType": "Space"
          },
          {
            "id": "*vpE_LTbA0n96Z0g9",
            "itemType": "Component"
          },
          {
            "id": "*MvnABULB035AQcAR",
            "itemType": "Workflow"
          },
          {
            "showDnD": true,
            "id": "*yiAvNQVn0sVwCwYo",
            "itemType": "Node"
          },
          {
            "id": "*bjR3r1yW0znPIEXS",
            "itemType": "Extension"
          },
          {
            "id": "*QY7INTkMW6iDj7uC",
            "itemType": "Collection"
          }
        ]
      }
    ]
  }
]
```

# Administrator workflows

The workflows described in this section of the documentation aim to support KNIME Business Hub administrators, or heavy KNIME Business Hub users, to clean up, monitor and better administrate their Business Hub instance.

The functionalities provided are a time saver for monitoring or administrating KNIME Business Hub, eliminating the need for manual work and centralizing information from various applications.

## Workflows overview

The user can access the workflows on the KNIME Community Hub in a [public space](#) owned by KNIME. Additionally, the user can find them on a dedicated [collection page](#). To use them, download the workflows from the Community Hub and upload them into an existing team space in your KNIME Business Hub installation.

Business Hub has three types of user roles (global admin, team admin, and team member). All the users with access to the “Admin Space” can run the workflows. The user’s role defines their allowed actions when running the different workflows.

The workflows can be run as data applications on-demand or directly scheduled using the Business Hub UI. First, you must deploy the workflows as a Data app or Schedule.

Below the list of workflows within the “Admin Space”, click on them to read further details:

- [Discard Failed Jobs](#)
- [List All Jobs](#)
- [Delete Old Versions](#)
- [Scheduled Workflows Kick-Off Times](#)
- [Count Workflows Running Per Day](#)
- [Workflows' Run Time](#)
- [Monitor Users' Usage](#)

## Requirements and prerequisites

## Requirements

- The user needs to exist and be at least a Team member (no matter the user's role) where the "Admin Space" is located
- Also, the user needs at least view access to the "Admin Space."

## Prerequisites

- The user should be familiar with new concepts on the Hub. See the KNIME Business Hub User Guide.
- The user needs to create an application password specific to her account on KNIME Business Hub that most applications will use.

## Discard Failed Jobs

### Overview

This workflow aims to keep "clean" the KNIME Business Hub installation by discarding failed jobs from any kind of execution run by the KNIME Business Hub users.

### Workflow specs

Without applying any time range, the workflow discards all failed jobs for the following execution types: **ad-hoc executions**, **triggers**, **data apps**, **schedules** or **shared deployments**.

We consider as failed jobs all those with any of the following states after execution: "Execution\_Failed", "Execution\_Failed\_With\_Content", "Execution\_Canceled", or "Vanished".

The failed jobs a user can discard depend on the role of the user running the workflow:

**Global admin:** can discard all failed jobs in any team and space from any execution type.

**Team admin:** can discard all failed jobs of the teams of which it is an admin from any execution type.

**Team member:** can discard only self-generated failed jobs from any execution type, any team and space of which it is a member (no matter the **user's right's** on space items). It also includes deployments shared with the user from teams where the user is not a member.

## Deployment configuration

This workflow can be deployed as a [data app](#) or [schedule](#) deployment.

In both cases, you can provide the following information to deploy the workflow:

1. **Hub URL:** The URL of your KNIME Business Hub instance, e.g. "https://my-business-hub.com".
2. **Application Password ID:** User-associated application password ID.
3. **Application Password:** User-associated application password.

If you want to know how to create an application password, follow [these steps](#).

## Data app

After deploying the workflow as a Data App, you can run it. To do so, follow [these instructions](#).

Below are the steps for the data app:

1. **Business Hub connection:** you need to connect to the KNIME Business Hub instance through the previously generated application password.
2. **Select Job State:** it is possible to customize which types of failed jobs you want to discard. Max 4 job states should be available: "Execution\_Failed", "Execution\_Failed\_With\_Content", "Execution\_Canceled", or "Vanished".
3. **Discard Results:** A table with the discard jobs results is displayed by default. There is also the possibility to see an illustrated version of the table by selecting the "Switch to charts" option.

## Discard Failed Jobs

## Schedule

1. Define when the workflow should be executed through the schedule options. For more information, follow [this guide](#).
2. Ensure the Schedule Deployment is active (*Status* column).
3. In the Team Deployments page or the workflow page, Deployments section, you can

check the number of executions and their status.

The screenshot shows the 'Deployments' section of the KNIME Business Hub interface. At the top, there's a header 'Deployments' and a search bar. Below it, a table lists deployments with columns: 'Type of depl...', 'Name', 'Workflow', 'Version', 'Date of cr...', 'Execution co...', and 'Status'. One deployment is selected, and a modal window is open showing a detailed view of that deployment. The modal window has a table with columns: 'Created at', 'Owner', 'State', and 'Node messages'. The data shows two rows, both with 'Execution finished' status and '12 Messages'.

| Created at           | Owner | State              | Node messages |
|----------------------|-------|--------------------|---------------|
| Apr. 12, 2023, 12:54 | diego | Execution finished | 12 Messages   |
| Apr. 12, 2023, 12:53 | diego | Execution finished | 12 Messages   |

## List All Jobs

### Overview

The workflow scope is to list all the jobs (excluding the failed ones) accessible to the user.

Additionally, the user can use the workflow to easily pinpoint any irregularities in the workflow's execution or sort jobs that have been in an execution state for an extended period.

Furthermore, it is possible to select the jobs and discard them.

### Workflow specs

Without applying any time range, the workflow lists all jobs for the following execution types: **ad-hoc executions**, **triggers**, **data apps**, **schedules** or **shared deployments**.

We only consider not failed jobs. This means we exclude any jobs with states such as: "Execution\_Failed", "Execution\_Failed\_With\_Content", "Execution\_Canceled", or "Vanished".

The job information a user could retrieve depends on the user role running the deployed workflow:

**Global admin:** can recover all workflow jobs in any team and space.

**Team admin:** can recover all workflow jobs within the team where it is an admin.

**Team member:** can recover workflow jobs from any team and space where is a member (no matter the **user's rights** on space items). It also includes shared deployments from teams where the user is not a member.

The jobs a user can discard depend on the role of the user running the deployed workflow:

**Global admin:** can discard all jobs in any team and space from any execution type.

**Team admin:** can discard all jobs of the teams of which it is an admin from any execution type.

**Team member:** can discard only self-generated jobs from any execution type, team and space of which it is a member (no matter the user's right on space items). It also includes deployments shared with the user from teams where the user is not a member.

## Deployment configuration

This workflow can be deployed as a [data app](#).

You can provide the following information to deploy the workflow:

1. **Hub URL:** The URL of your KNIME Business Hub instance, e.g. "https://my-business-hub.com".
2. **Application Password ID:** User-associated application password ID.
3. **Application Password:** User-associated application password.

If you want to know how to create an application password, follow [these steps](#).

## Data app

After deploying the workflow as a Data App, you can run it. To do so, follow the [instructions](#).

Below are the steps for the data app:

1. **Business Hub connection:** you need to connect to the KNIME Business Hub instance through the previously generated application password.
2. **Explore and select Jobs:** this feature displays a table of all available jobs for the user. Each job is listed with its name, state, runtime information, and corresponding workflow deployment.

Two exceptions related to the job's deployment information:

- a. When ad-hoc executions generate jobs, the deployment name is not available.
- b. If the workflow is executed when a deployment that has generated a job is not available anymore in the KNIME Business Hub (because it has been discarded or, in the case of schedules, the deployment has ended), retrieving the deployment

information is not possible. It displays a message in the "Deployment name" column: "This deployment is no longer available."

On the right side, the user can find three filters:

- Run time anomalies: it detects outliers using the **Numeric Outliers** node. As a user, you can focus on "Outliers", which will help you identify jobs that take significantly longer or shorter to execute than others within the same workflow deployment.
- Job state: It allows filtering by specific job states. The available job states will be shown based on the currently listed jobs.
- Team: the user can filter by team.

3. **Discard Results:** A table with the discard jobs results is displayed by default. There is also the possibility to see an illustrated version of the table by selecting the "Switch to charts" option.

## Delete Old Versions

### Overview

The workflow aims to delete old item versions that aren't involved in any deployment. The sought effect of this operation is to avoid a massive proliferation of item versions within the

Business Hub installation, impacting disk space.

## Workflow specs

The workflow deletes all item versions older than the specified number of days, e.g. older than seven days.

The deletion will only be applied to the selected teams and spaces using the workflow as a data app or schedule deployment.

In cases where a rule applies to all versions in a space, the latest version will not be deleted, even if it is affected by the rule. Additionally, item versions that are involved in deployments are exempt from the rule.

Depending on your user role on the KNIME Business Hub, if you execute this workflow, you will have the following permissions:

**Global admin:** Can delete every item version not used in any deployment from any team on the KNIME Business Hub instance.

**Team admin:** Can only delete the item versions not involved in any deployment in the team where it's an admin.

**Team member:** Can only delete the item versions not involved in any deployment in the teams where it's a member. The Team member must have "Edit" permissions for the targeted spaces to perform the version deletion.

## Deployment configuration

This workflow can be deployed as a **data app** or **schedule** deployment.

You need to provide the following information to deploy the workflow as a data app or to schedule it:

1. Hub URL: The URL of your KNIME Business Hub instance, e.g. "https://my-business-hub.com".
2. Application Password ID: User-associated application password ID.
3. Application Password: User-associated application password.
4. Team name: Use "\*" to select all and "/" to choose a subset: "Team1/Team2".
5. Space name: Use "\*" to select all and "/" to choose a subset: "Space1/Space2".
6. The number of days: All item versions older than that will be deleted (default is 30)

days).

To create an application password, follow [these steps](#).

## Data app

After deploying the workflow as a data app, you can run it. To do so, follow these [instructions](#). Below are listed the steps for the data app::

- 1. Business Hub connection:** You need to connect to the KNIME Business Hub instance through the application password generated previously.
- 2. Team and Space selection:** Select the teams and associated spaces from which the workflow should delete the old versions.
- 3. Define version deletion rule:** Here, you can set a version deletion rule. All versions older than the given number of days will be deleted.
- 4. Deletion result:** A table showing the deletion result with the version information will appear by default.

Switching to a chart view is possible using the “Switch to charts” option.

## Schedule

1. Define when the workflow should be executed through the schedule options. For more information, follow [this guide](#).
2. Ensure the Schedule Deployment is active (*Status* column).
3. In the Team Deployments page or the workflow page, Deployments section, you can check the number of executions and their status.

## Scheduled Workflows Kick-Off Times

### Overview

The workflow aims to prevent scheduled deployments from overlapping and, consequently, helps to avoid overloading KNIME Business Hub executors.

Running on demand as a data app offers the user a visual overview of the scheduled deployments within the given number of days by team and execution context.

## Workflow specs

The workflow visualizes all the scheduled deployments by KNIME Business Hub execution context and team in the following days. Notice that the maximum number of days is set up to seven.

The workflow shows only those schedules whose deployment is active and has not been disabled via the KNIME Analytics Platform and those with a valid next execution date.

Depending on the user role, you can view the following schedules:

**Global admin:** monitor the scheduled workflows of any team and any KNIME Business Hub execution context.

**Team admin:** monitor the scheduled workflows for any KNIME Business Hub execution context in the team.

**Team member:** monitor the scheduled workflows for any KNIME Business Hub execution context in the team.

## Deployment configuration

This workflow can be deployed as a [data app](#).

You can provide the following information to deploy the workflow as a data app:

1. Hub URL: The URL of your KNIME Business Hub instance, e.g. "https://my-business-hub.com".
2. Application Password ID: User-associated application password ID.
3. Application Password: User-associated application password.

To create an application password, follow [these steps](#).

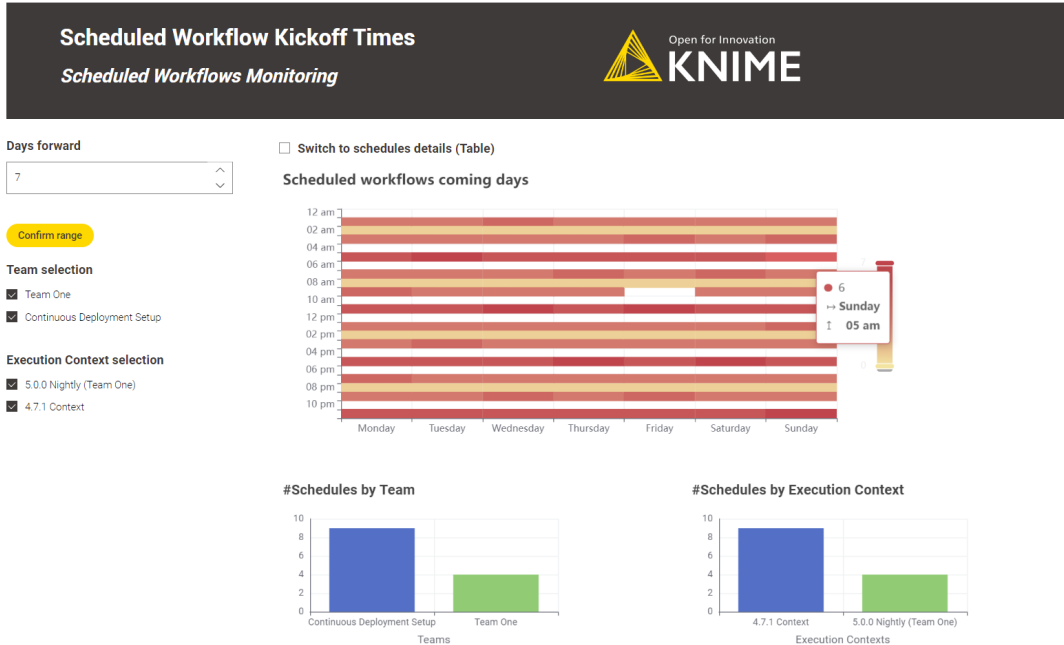

## Data app

After deploying the workflow as a data app, you can run it. To do so, follow these [instructions](#). Below are the steps for the data app:

1. **Business Hub connection:** You need to connect to the KNIME Business Hub instance through the application password generated previously.
2. **Scheduled Workflows Monitoring:** By default, it visually represents the scheduled workflows in the coming days.

The number of scheduled workflows per day and hour and the number of schedules by team and execution context are represented.

Diving deep into each scheduled deployment is possible by switching to a “Table” mode. Use the “Switch to schedules details (Table)” option.

## Count Workflows Running Per Day

### Overview

After a while, the KNIME Business Hub instance automatically discards already executed workflow jobs. KNIME Business Hub administrators can define this time window until a specific period, but it is not infinite.

The workflow scope is to go beyond this automatic discard timeline creating a historical file with all the workflow execution information for further consultation.

### Workflow specs

The workflow saves in the root level of an existing team space a CSV file of the jobs information of any state ("Executed", "Failed", etc.) and from any execution type (Deployments and Ad-hoc executions).

The workflow job information a user could retrieve depends on the user role running the deployed workflow:

**Global admin:** can recover all workflow jobs in any team and space.

**Team admin:** can recover all workflow jobs within the team where it is an admin.

**Team member:** can recover workflow jobs from any team and space where is a member (no matter the **user's right's** on space items). It also includes shared deployments from teams where the user is not a member.

The team space where the CSV file can be saved depends on the user role running the deployed workflow:

**Global admin:** can save workflow job information in any team space.

**Team admin:** can save workflow job information in every team space where it is an admin.

**Team member:** can save workflow job information in every team space where it is a member and it has edit permissions.

The user must define the number of backward days you want to retrieve the workflow job information, e.g. last five days.

If you repeatedly target the same team space executing this workflow, the workflow will append the new information to the master file.

## Deployment configuration

This workflow can be deployed as a [data app](#) or [schedule](#) deployment.

You can provide the following information to deploy the workflow as a data app or schedule it:

1. Hub URL: The URL of your KNIME Business Hub instance, e.g. "https://my-business-hub.com".
2. Application Password ID: User-associated application password ID.
3. Application Password: User-associated application password.
4. Last n days filter: Save job information of all jobs from the last n days.
5. Select the destination Team: The team in which the job information will be saved.
6. Select the destination Space: The space in which the job information will be saved.

To create an application password, follow [these steps](#).

## Data app

After deploying the workflow as a data app, you can run it. To do so, follow these [instructions](#). Below are the steps for the data app:

1. **Business Hub connection:** You need to connect to the KNIME Business Hub instance through the previously generated application password.
2. **Set rule and file destination:** Select the last n days to save the workflow job information. And choose the destination team and space where this file will be saved.
3. **File location link and preview:** You can find the link to the destination space and a preview of the saved job information.

## Workflows running per day

*File location link and preview*

You can find the file with the workflows running per day here: [User space](#)

#### Job state filter

- EXECUTION\_FINISHED
- EXECUTION\_FAILED
- INTERACTION\_REQUIRED

[← Back](#)

## Schedule

1. Define when the workflow should be executed through the schedule options. For more information, follow [this guide](#).

It is recommended to adjust the last n days' field to the chosen schedule option, e.g. if the workflow is scheduled every seven days, set the last n days to seven to avoid duplicate information in the CSV file.

2. Ensure the Schedule Deployment is active (*Status* column).
3. In the Team Deployments page or the workflow page, Deployments section, you can check the number of executions and their status.

## Workflows' Run Time

### Overview

This workflow aims to list all the workflows sorted by the average execution time (the greater the first) for the last n days.

### Workflow specs

We calculate the run time by solely considering the deployed schedules, as monitoring the

execution time of other deployment types is not meaningful. For example, a user could play around one hour or five minutes with a data app.

The average workflow execution time and the standard deviation are calculated for the given period.

Be aware that the number of days a workflow deployment's job is available depends on the KNIME Business Hub instance's configuration, e.g. a common value would be seven days. After that period, all jobs would be discarded automatically.

The average jobs run time, which a user can monitor, depends on the role of the user running the deployed workflow:

**Global admin:** can monitor the run time of all deployed schedules in any Team and Space.

**Team admin:** can monitor the run time of all deployed schedules within the Team where it is an admin.

**Team member:** can monitor the run time of all deployed schedules within the Team where it is a member.

## Deployment configuration

This workflow is designed to be deployed only as a [data app](#).

You can provide the following information to deploy the workflow:

1. Hub URL: The URL of your KNIME Business Hub instance, e.g. "https://my-business-hub.com".
2. Application Password ID: User-associated application password ID.
3. Application Password: User-associated application password.
4. Last n days filter: number of days from calculating the average execution time, e.g. last seven days.

If you want to know how to create an application password, follow [these steps](#).

## Data app

After deploying the workflow as a data app, you can run it. To do so, follow these [instructions](#). Below are the steps for the data app:

1. **Business Hub connection:** You need to connect to the KNIME Business Hub instance

through the application password generated previously.

2. **Workflow performances:** A performance overview of the deployed workflows for the last n days. Diving deep into any workflow performance is possible by selecting the workflow and clicking the “workflow details” button. When diving deep into the workflow, each workflow’s average run time calculation is calculated per day (stacked area chart).

## Workflows' Run Time

## Monitor Users' Usage

### Overview

The workflow aims to track KNIME Business Hub user logins to better manage the KNIME Business Hub users' quantity and instance usage.

### Workflow specs

You need access to the Keycloak instance embedded in KNIME Business Hub to generate the Client Id and Secret necessary to access the KNIME Business Hub user information.

The workflow shows information about two users type: active and inactive.

Inactive users: those who have never logged into the KNIME Business Hub instance since their creation date.

Active users: those who logged into the KNIME Business Hub instance in the last n days.

It is possible to analyse the session length for actively engaged users. However, it's important to note that if a user doesn't log out after each session, it could impact the accuracy of the KPI calculation. As a result, this metric cannot be considered completely dependable.

## Deployment configuration

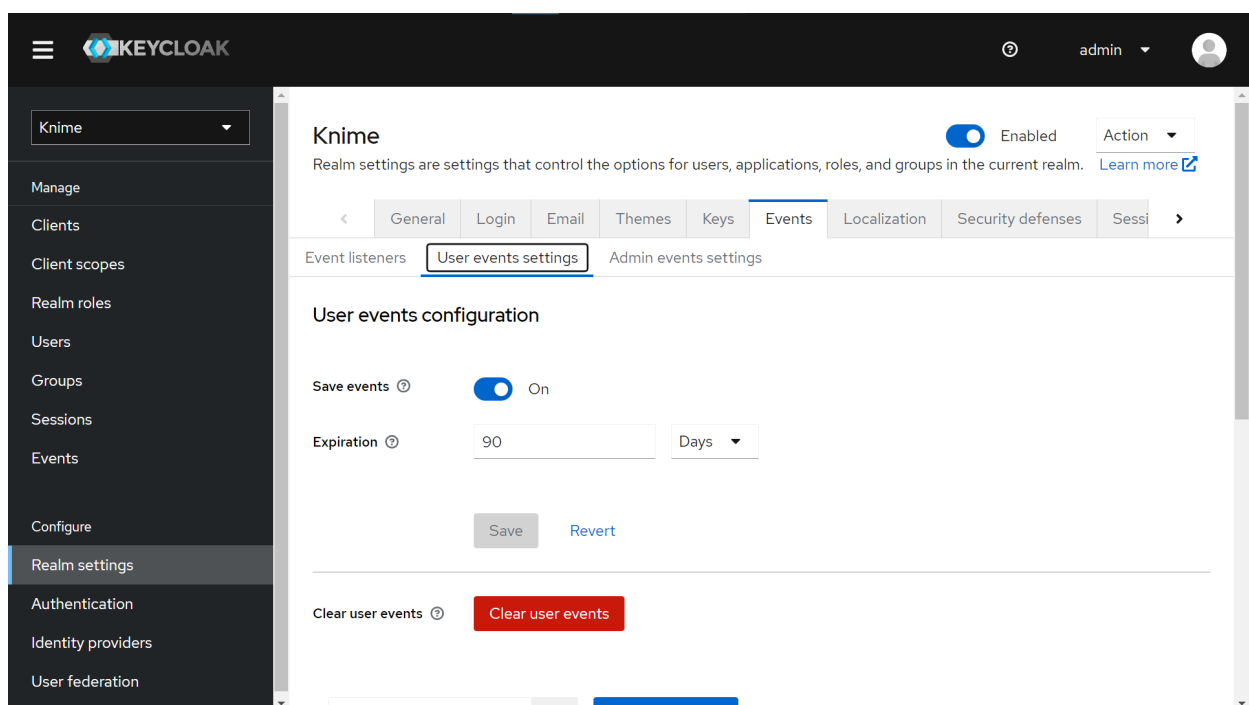

This workflow is designed to be deployed only as a **data app**.

You can provide the following information to deploy the workflow:

1. Hub URL: The URL of your KNIME Business Hub instance, e.g. "https://my-business-hub.com".
2. Keycloak Client ID: your-ClientId from Keycloak.
3. Keycloak Client Secret: your-Client-Secret from Keycloak.

To generate a Keycloak Client ID and Client Secret:

1. Login into Keycloak Admin Console: "https://auth.my-business-hub.com > Administration Console".
2. Select your Realm, and from "Realm Settings > Events > User events settings", activate "Save events" to save KNIME Business Hub Users events. You can configure how many days to keep the user's events.

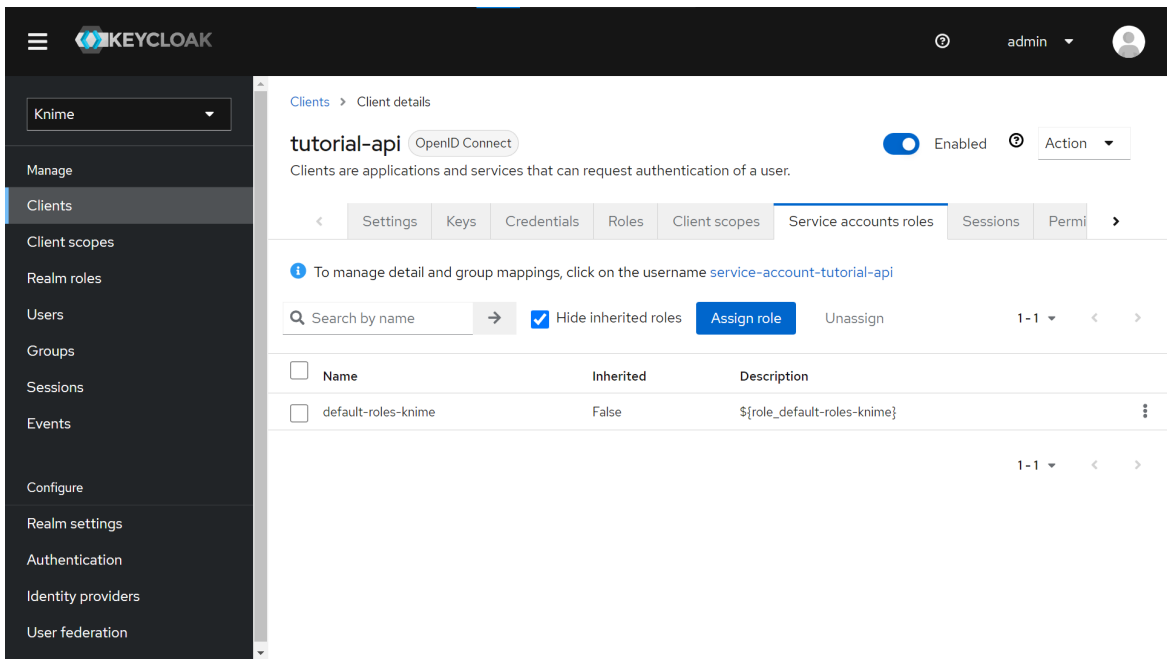

3. Create a new Client from “Clients > Create Client”. Give it a Client ID (tutorial-api in our example), a name (tutorial) and a description (lorem ipsum).

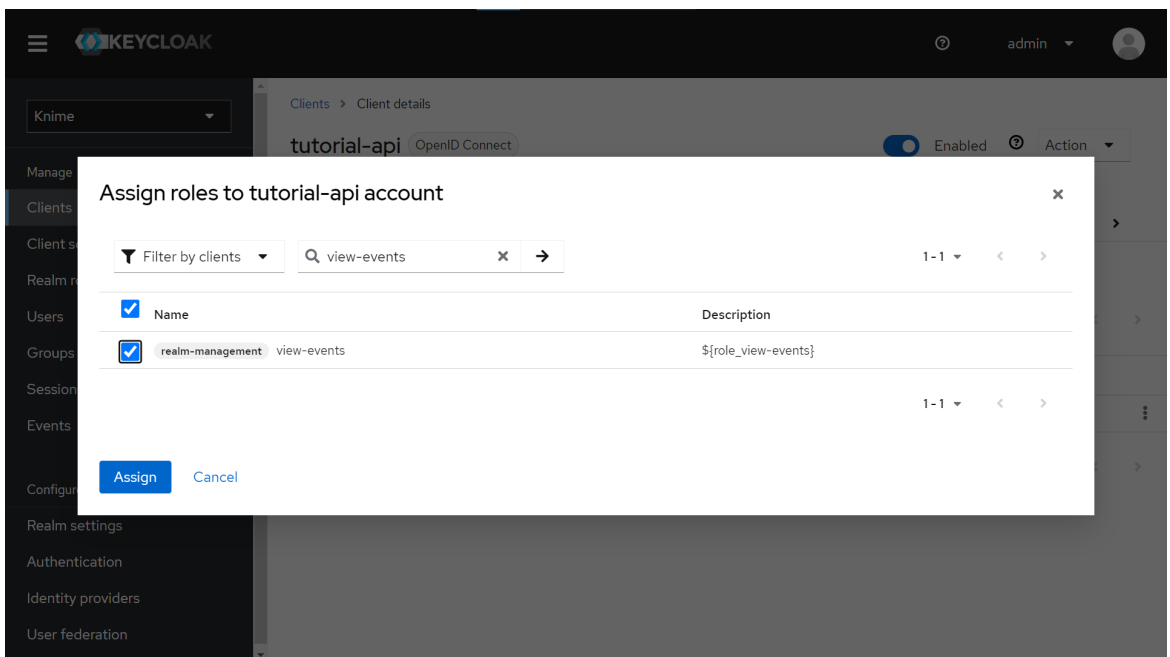

- a. In the “Capability config” section, activate “Client authentication”.
- b. Select “Service account roles” to allow you to authenticate this client to Keycloak and retrieve the access token dedicated to this client.
- c. Save your new client.

4. Click on your new Client (tutorial-api) from “Clients > Client ID (Column)”.
  - a. Go to the “Service account roles” tab > Click the “Assign role” button.

- b. Click “Filter by Roles” and select “Filter by clients”.
- c. Search for “view-events” and for “manage-users” and assign both roles to the Service account associated with our client.

- 5. Finally, to retrieve the Client ID and Client secret:
  - a. Go to “Clients > Client ID (Column)” and choose your client (tutorial-api in our example)
  - b. Click on the “Credentials” tab
  - c. Leave as a Client Authenticator the “Client ID and Secret” option.
  - d. Copy the Client’s Secret.

e. Copy the Client ID from the top of the tab (“tutorial-api” in the screenshot below).

## Data app

After deploying the workflow as a data app, you can run it. To do so, follow these [instructions](#). Below are the steps for the data app:

**Keycloak connection:** the user must connect to the Keycloak instance embedded in KNIME Business Hub through the previously generated Client ID and Secret.

**User login events:** Select the last n days to see KNIME Business Hub active users' login count and inactive users' information. It is possible to explore the active users' session length.

Also, the user can switch to chart mode by clicking the “Switch to charts” option.

# KNIME Business Hub API documentation

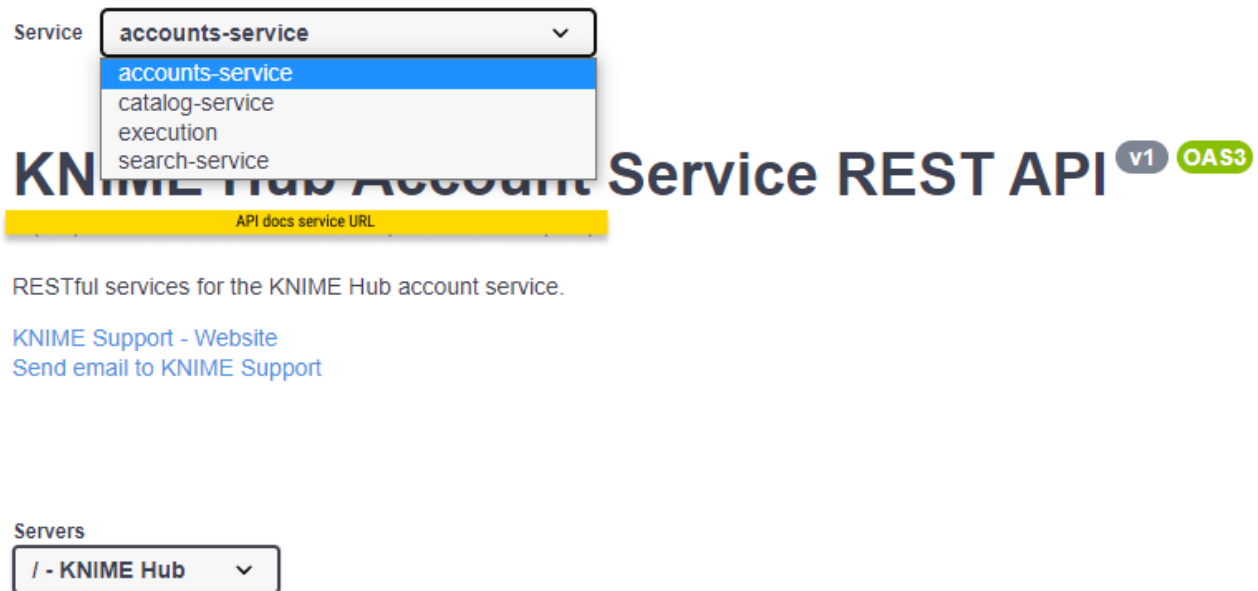

Most KNIME Business Hub functionalities are also available via REST API allowing you to perform several actions.

You can access the API documentation by navigating to the following URL:

```
api.<base-url>/api-doc
```

where <base-url> is your Business Hub instance URL, e.g. hub.example.com.

Here you can select from the drop-down menu the service you want to use.

# Support Bundles and Troubleshooting

When generating a support bundle, **no data leaves the cluster**.

If necessary, you can download the support bundle and send it to KNIME for the purpose of troubleshooting. Under extreme circumstances, the KNIME team may forward the support bundle to the Replicated support team for additional help.

When generating a support bundle, a limited amount of information will be automatically redacted (IPv4 addresses, connection strings, etc.). You can configure additional redactions and/or manually redact information prior to sending the bundle. See the **Configuring redaction in support bundles** section for more details.

KNIME Business Hub is capable of generating support bundles in a standard format, even when the admin console isn't working. This ensures that users are able to provide all of the necessary information for KNIME to be able to identify the problem and prescribe a solution.

## Generating a support bundle (GUI)

In order to help troubleshoot an installation, or to simply inspect the logs of the cluster in a user-friendly format, you will need to generate a support bundle.

Simply open the KOTS Admin Console, navigate to the **Troubleshoot** pane, and click the **Generate a support bundle** button to generate a support bundle.

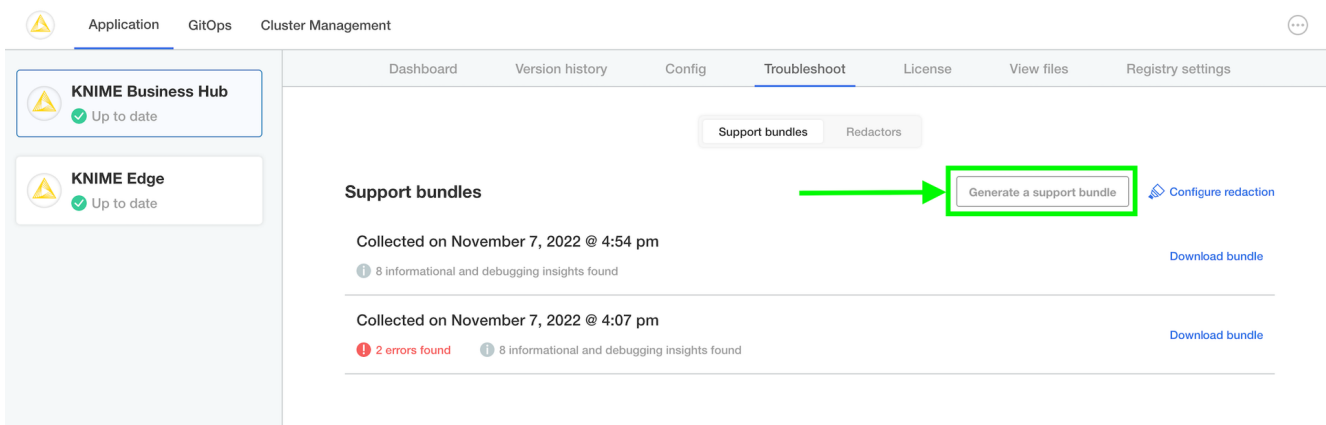

Figure 8. Generate a support bundle

All generated support bundles will display in the list above. Click the **Download bundle** button to download the bundle(s) you want to share with KNIME, and please see the **Configuring redaction in support bundles** section for information on how to redact confidential/personal information before sending.

## Generating a support bundle (CLI)

See [Replicated documentation](#) for instructions on how to generate a support bundle via the Replicated CLI.

## Configuring redaction in support bundles

When generating a support bundle, a limited amount of information will be automatically redacted (IPv4 addresses, connection strings, etc.) but it is not guaranteed to be a comprehensive set of redactions. You may have additional information in your logs or configuration that you do not wish to share with the KNIME engineering team.

One option is to unzip the generated .zip support bundle and manually review/redact information prior to sending the bundle to KNIME. However, there is a lot of information to review and the redaction of certain information can be automated fairly easily. The ideal option is to configure automated redactions via [Redactor](#) resources, which will automatically redact information for all future support bundles.

In order to configure automated redactors, first open the KOTS Admin Console. Navigate to the **Troubleshoot** pane and click **Configure Redaction**.

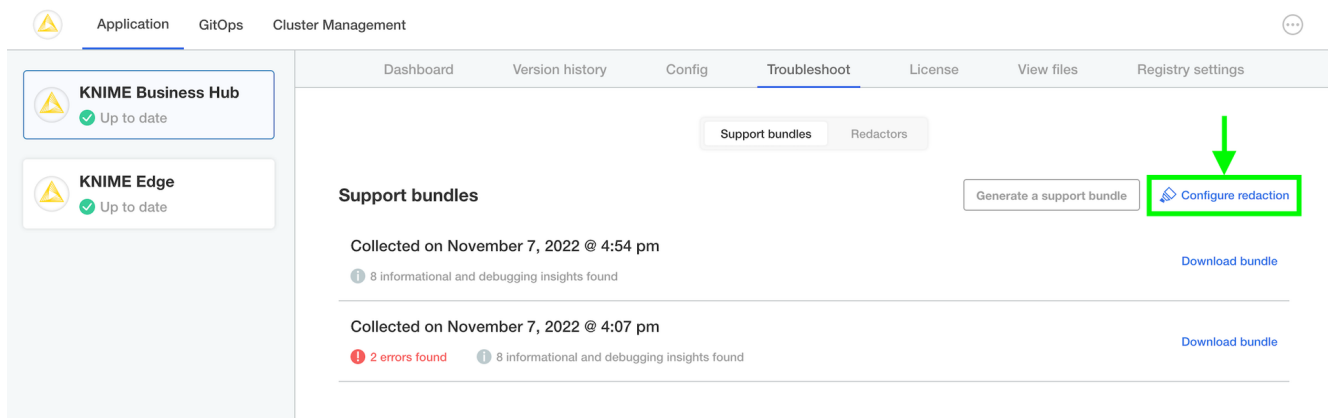

Figure 9. Configure Redaction

If you have configured your own custom redactions that you feel would be valuable to other users of KNIME Business Hub, please feel encouraged to share the configuration with KNIME so that it can be considered & potentially added to future releases.

See [this link](#) and [this link](#) for more information.

## Inspecting support bundles

There are quite a number of files generated in a support bundle. Not necessarily every file

is useful for every problem. However, by collecting the same information in the same way each time, KNIME can ensure the best quality support possible for customers.

It is possible to inspect a support bundle entirely in the admin console. See below for an example screenshot.

Figure 10. Inspect a support bundle in the admin console

Here are the most important folders/files and their purposes:

| Path            | Purpose   | Example (may have properties omitted)   |
|-----------------|---|---|
| ./analysis.json | <ul style="list-style-type: none"> <li>Collects the highest-level insights possible for the installation.</li> <li>Often times, the issue and/or resolution may be identified in this file by inspecting the <code>[].name.insight.detail</code> property.</li> </ul> | <pre>[   {     "name": "kotsadm.status",     "insight": {       "name": "kotsadm.status",       "primary": "kotsadm Status",       "detail": "At least 1 replica of the Admin Console API is running and ready",       "severity": "debug"     },     "severity": "debug",     "analyzerSpec": ""   } ]</pre> |
| ./logs          | <ul style="list-style-type: none"> <li>Contains logs of individual pods.</li> <li>Execution Context logs are stored in <code>./logs/execution-contexts</code>.</li> </ul>   | (typical application logs)  |

| Path                | Purpose   | Example (may have properties omitted)  |
|---------------------|---|--|
| ./cluster-resources | <ul style="list-style-type: none"><li>• Contains the configuration of each visible resource in the cluster.</li><li>• For example, to see all pods in the cluster, navigate to the ./cluster-resources/pods directory which contains one file per namespace in the cluster.</li></ul> | <pre data-bbox="1034 331 1444 705">{<br/>  "kind": "PodList",<br/>  "apiVersion": "v1",<br/>  "metadata": {<br/>    "resourceVersion":<br/>    "1686941"<br/>  },<br/>  "items": [ ... ]<br/>}</pre> |

# Backup and restore with Velero Snapshots and Kotsadm

Snapshot backups and restore features are available into Replicated deployments via Velero, a tool for backing up Kubernetes cluster resources and persistent volumes.

One-time snapshots as well as automated scheduled snapshots can be managed from the *Snapshots* panel within your Kotsadm dashboard at <https://<base-url>:8800/app/knime-hub>.

Snapshot creation and restoration are disruptive processes. KNIME applications, and Replicated admin access may be unavailable during an active backup or restore operation.

## Creating snapshot backups

1. First, configure storage for your backups. Navigate to the *Snapshots* tab of your Kotsadm dashboard. Click the 'Settings' button to edit backup settings where you'll be able to add a storage target.

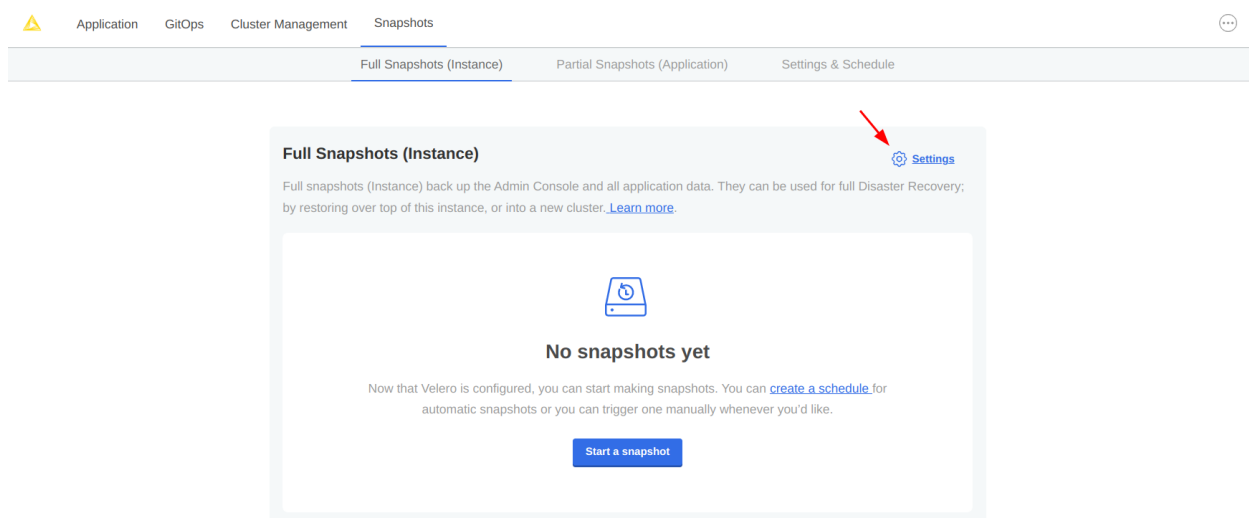

Figure 11. Snapshots tab with settings link

2. Velero supports local storage (not recommended), Amazon S3, Azure Blob Store, Google Cloud Storage, and S3 API compatible storage endpoints such as Minio. Select your preferred snapshot storage type from the 'Destination' drop-down menu, and fill in the required fields with parameters specific to your storage endpoint. Click the 'Update storage settings' button and wait for Velero to verify backup storage access.

Figure 12. Snapshots destination settings for AWS S3 storage

3. With a valid backup storage configured, you can create a Snapshot of your KNIME deployment by clicking the *Full Snapshots* tab, and then the *Start a snapshot* button. This may take a few minutes to complete.
4. Once your snapshot is complete, from the same *Full Snapshots* screen, you can click the 'Settings' button to manage snapshot retention, or configure automatic snapshots by checking the *Enable automatic scheduled snapshots* box and setting a schedule using a CRON expression.

### Automatic snapshots

Set up a custom schedule and retention policy for automatic snapshots of the Admin Console and all application data.

Full snapshots (Instance)      Partial snapshots (Application)

---

Enable automatic scheduled snapshots

**Schedule**      **Cron expression**

Weekly | v      0 0 \*\* MON

At 12:00 AM, only on Monday

**Retention policy**

The Admin Console can reclaim space by automatically deleting older scheduled snapshots.

Snapshots older than this will be deleted.

1      Months | v

**Update schedule**

Figure 13. Example automatic snapshot scheduled to run at 12:00am weekly with a 1 month retention policy.

## Restoring a snapshot

1. Navigate to the list of available snapshot restore points from your Kotsadm dashboard by browsing to *Snapshots* → *Full Snapshots*. From this screen, identify the snapshot

instance you would like to use, and take note of the instance ID.

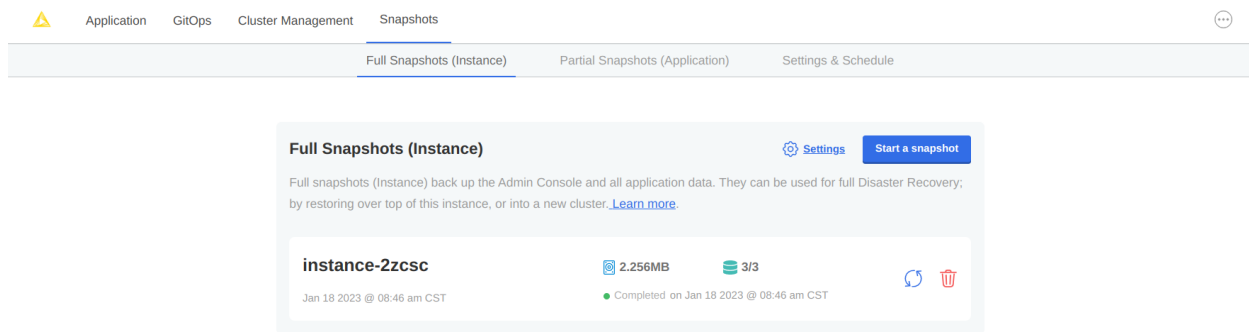

Figure 14. In this example, there is only one snapshot available and its ID is instance-2zcsc

A list of snapshots can also be retrieved by command line:

```
$ kubectl kots get backups
NAME          STATUS      ERRORS  WARNINGS  STARTED
COMPLETED
instance-2zcsc  Completed  0       0         2023-01-18 14:46:26 +0000 UTC
2023-01-18 14:46:53 +0000 UTC  29d
```

2. Now, restore the snapshot using a single CLI command.

```
$ kubectl kots restore --from-backup {Snapshot ID}
```

3. Assuming the restore completed without errors, you can verify your Hub installation is functioning as expected.

# Migration of versioning and compatibility

With the 1.5 release of the KNIME Business Hub we introduced the new item level versioning, migrating from space level versioning that was made available in the previous releases.

This means that users can now create, restore and delete versions of individual items as described in the [versioning section](#) of the KNIME Business Hub User Guide.

The KNIME Business Hub version 1.5 is fully compatible with KNIME Analytics Platform version 5.1, which can create versions of item to use for ad hoc execution, create deployments and update components. When upgrading to version 1.5 all items in previously versioned spaces are automatically migrated to be versioned on the single item level. However we recommend to perform a [backup](#) of your KNIME Business Hub instance.

## General compatibility between KNIME Hub, KNIME Analytics Platform client and executor

- KNIME Business Hub from version 1.5.0:
  - Analytics Platform version 5.1 client is fully compatible as previously stated
  - Executor version 5.1 is fully compatible
  - All the Analytics Platform and Executor versions < 5.1 are also compatible
- KNIME Business Hub version 1.4.2:
  - Executor version 5.1 is compatible
  - New nodes for versioning of Analytics Platform version 5.1 are not usable
- KNIME Business Hub version 1.4.1:
  - Executor version 5.1 is compatible
  - New nodes for versioning of Analytics Platform version 5.1 are not usable
  - Workflow uploads do not work via Analytics Platform version 5.1

## Migration from space level versioning to item level versioning

- KNIME Business Hub 1.5.0 (with item level versioning):
  - Analytics Platform version 5.1:
    - Space Connector node will not have the version selection functionality.
    - The Space Version Creator node is replaced by the Version Creator node.

- Analytics Platform version < 4.7:  
Drag and drop of repository items will stop working
- Analytics Platform version < 5.1:  
Space Version Creator nodes will stop working.  
Space Connector nodes will stop working when the version checkbox is checked.  
They will work if the version checkbox is unchecked.
- Any Executor from version 4.7:  
Deployments migrated from Business Hub version 1.4.x are compatible although they might require some attention/adjustments for more complex cases.  
Deployments created with Business Hub version 1.5 are fully compatible.
- KNIME Business Hub 1.4.x (with space level versioning):
  - Analytics Platform version 5.1:  
Space connector nodes will not have the version selection functionality and will default to *latest*.  
Version Creator node will not work.
  - Executor version 5.1 is compatible for simple deployments although some more complex deployments might require some attention/adjustments.

# Changelog (KNIME Business Hub 1.5)

## KNIME Business Hub 1.5.2

(released Aug 14, 2023)

### Important installation notes

Postgres will restart during the update, short downtime is expected.

### Infrastructure updates

KNIME Business Hub is now compatible with Kubernetes 1.25.

## KNIME Business Hub 1.5.1

(released July 27, 2023)

### Important Bugfixes

- **HUB-5628** Fixed an issue that prevented the creation of disabled schedules. Impacting KNIME Server to Hub migration.
- **HUB-5649** Fixed a bug that prevented notification service updates when a subscription for a deleted user was present.
- Fixed a configuration issue that caused the trigger-service to not start up in some scenarios.

## KNIME Business Hub 1.5.0

(released July 17, 2023)

### Important installation notes

All executor pods will restart during the update, some downtime is expected. Creating a backup before upgrading is recommended.

## New Features

### Item level versioning

- Item level versioning has been introduced with Hub 1.5.0
- Users can create / restore / delete versions of individual items
- Item versions can be utilized in Ad hoc execution, Deployments
- Using KNIME Analytics Platform 5.1 users can leverage item level versioning for Ad hoc execution, sharing component links and use new nodes like the "Version Creator"
- Space level versioning has been deprecated
- All items in previously versioned spaces are automatically migrated to be versioned on item level upon updating

### Volume Mount support for Execution Contexts

- Kubernetes volumes can now be attached to Execution Contexts by editing the custom resource definition.
- This allows attaching secrets and config maps as files to Execution Contexts.

## Improvements

### Keycloak enforces username validation

- Username restrictions described in the [KNIME Business Hub Installation Guide]([https://docs.knime.com/latest/business\\_hub\\_installation\\_guide/index.html#\\_keycloak\\_setup](https://docs.knime.com/latest/business_hub_installation_guide/index.html#_keycloak_setup)) are now enforced by KNIME Business Hub's identity provider Keycloak. Preventing problems where users could be synced into Hub but they could not login with their credentials.

### Notifications redesign

- KNIME Business Hub UI notifications were redesigned to be less intrusive and to be more convenient for users.

## Schedule deployment

- Initial start date of schedules can no longer be in the past.

## Space permissions

- Users with viewer permission can no longer delete spaces

## Infrastructure updates

### Artemis update

- Artemis version has been updated to 2.29.0

### Quarkus update

- Quarkus has been updated to 3.1.1 in the execution services

### Execution Context security hardening

- Execution Contexts now have a more restrictive security context to help prevent containers from escalating privileges and prevent running as root user. This increases compliance with typical enterprise cluster security policies enforced with tools such as Kyverno.

## Important Bugfixes

- **HUB-4991** - Fixed a bug where users were not able to execute deployments shared with them, if they didn't have access to the deployed workflow.
- **HUB-5396** - Fixed the state persistor issue that could result in timeouts and various problems in workflow execution on the Hub.

# Changelog (KNIME Business Hub 1.4)

## KNIME Business Hub 1.4.2

Main motivation for the 1.4.2 KNIME Business Hub release is to prepare for the upcoming 5.1 KNIME Analytics Platform release. It is an optional update as 1.5.0 Business Hub is coming out with all new features before AP 5.1.

### Improvements

Support for using KNIME Analytics Platform 5.1 as a workflow editor. Compatibility with uploading workflows to the Hub using KNIME AP 5.1.

### Important Bugfix

- **HUB-5396** - Fixed the state persistor issue that could result in timeouts and various problems in workflow execution on the Hub.

## KNIME Business Hub 1.4.1

### Important Bugfixes

- **Fix Bug** disabled functionalities for interacting with components in the HUB from AP versions (4.7.0, 4.7.1, 4.7.2, 4.7.3, 5.0.0) affected by a bug in which saving shared components might delete local workspaces
- Listing HUB spaces from affected AP versions will return the components as data objects, which don't have the potential to trigger the bug, but limits the use of components.
- Changed file extension for downloading components from .knwf to .knar.

## KNIME Business Hub 1.4.0

### Important installation notes

Please calculate with some downtime during which some services might not be available.

## New Features

### Data apps

#### **Share data app deployments with "any signed in user"**

You can now share your data apps with every Hub user in your company with one setting. Data app deployments shared this way will be available in every user's data apps portal.

#### **Share data app deployments with external groups**

Sharing data app deployments with users from externally managed groups (e.g. LDAP/AD groups) is now available. This is done by either importing LDAP groups to Keycloak, or by connecting Keycloak to an external OIDC provider, which provides groups through the access token. Usage of such external groups is for sharing of data app deployments only. The actual users who run the deployments are still managed within KNIME Business Hub.

#### **Data Apps Portal UX enhancements**

Enhanced the visual design and user experience of the data apps portal, enabling the addition of categories and descriptions to data apps. This enhancement allows data app consumers to effortlessly filter and identify relevant data apps based on their category and description.

#### **Content Security Policy for data apps**

Admins of KNIME Business Hub can now set custom Content Security Policies for data apps, to restrict which resources, from where can be loaded into the data app's user's browser. See more in: [Business Hub Admin Guide](#).

### Deployments

#### **Editing deployments**

Recreating deployments is no longer needed just to change their configuration.

### Admin functionality

#### **Backup / restore via Velero**

KNIME Business Hub is now complemented with the widely used, open-source backup / restore tool: Velero. You can mitigate the risk of serious data loss by setting up a backup schedule. The backup process does not require any downtime.

#### **X-Frame-Options Header**

Now admins can also select from different X-Frame-Options header options, to prevent clickjacking attacks. See more in: [Business Hub Admin Guide](#).

## Security

Improved security by removing sensitive information shown in the HTML source code.

Edge

## KNIME Edge integration

KNIME Edge 1.3 is now compatible with KNIME Business Hub 1.4.

## Important Bugfixes

- HUB-4774: Next execution time for schedules repeating every 24 hours cannot be computed
- HUB-5093: Heap size calculation doesn't work on Ubuntu 22.04 (Cgroups V2), leading to a too low limit being set for various services

# Changelog (KNIME Business Hub 1.3.0)

## KNIME Business Hub 1.3.0

(released April 03, 2023)

### Important installation notes

- With the release of KNIME Business Hub 1.3.0 new security features are introduced regarding executor communication. For this reason, KNIME Business Hub requires every executor to be on Analytics Platform version 4.7.1 or higher. You can find a list of the available executor images [here](#).
- With this release we changed the istio configuration of two services, to allow them to see the IP of the caller if the request is coming from within the cluster. This can cause those two services (`keycloak-proxy`, `s3-proxy`) to not start up in some scenarios, with a "too many open files" error in the istio-proxy container of those pods. This can be fixed by increasing the open file limit on the host VM, e.g. by running the following command:  
`sudo sysctl fs.inotify.max_user_instances=8192.`
- The KOTS App Manager is now on version 1.96.3. This new version fixes an important bug, so it should be updated before updating to KNIME Business Hub version 1.3. To do so use the following command:  
`curl -sSL https://curl.sh/knime-hub | sudo bash.`

- If you haven't updated to KNIME Business Hub 1.2.0, yet, you need to follow update guide in the [changelog](#) for 1.2.0 before updating to 1.3.

## New Features

### **Molecule sketcher**

Use the new Molecule Widget (Labs) node to accept molecule input from your users. With this new node we made the integration of different sketchers easier and allowed to provide different sketchers also for the KNIME Analytics Platform. In this release the ketcher sketcher is included. Additional sketchers will follow in the upcoming releases.

### **Collections**

Introduce your users to a topic using collection pages. Collection pages serve as a starting point for your users to explore examples and building blocks related to your chosen topic, facilitating their onboarding process. To start creating collections read our guide [here](#).

### **KNIME Analytics Platform customization profiles**

Use Business Hub to distribute preference profiles to either local Analytics Platform clients or to KNIME Hub executors. This can be used to e.g. easily ship database drivers. More information about Analytics Platform customization profiles [here](#).

### **Trigger deployment**

Trigger is a powerful new type of deployment which allows automating workflow execution based on specific conditions, such as another workflow or component being added or removed to a space. To get started with Triggers, check out our documentation [here](#).

# Changelog (KNIME Business Hub 1.2.0)

## KNIME Business Hub 1.2.0

(released March 13, 2023)

### KNIME Business Hub 1.1.1 to 1.2.0 Upgrade

- KNIME Business Hub 1.2.0 is expected to run in a Kubernetes 1.23.x cluster. Prior versions of KNIME Business Hub ran in Kubernetes 1.21.x clusters.
- For embedded kurl cluster installations, the cluster update process is to:

- First, check for updates in KOTS Admin Console.
- Once the KNIME Business Hub 1.2.0 update has been identified and preflight checks have been run, trigger the deployment.
- After the deployment process has completed, run the following command in the terminal of the host machine to upgrade the Kubernetes cluster version (among other components):
  - `curl -sSL https://kurl.sh/knime-hub | sudo bash`
  - You will have to enter `y` to various yes/no prompts during this upgrade process.

## New Features

- New supported Kubernetes versions: 1.22, 1.23, 1.24
- Keycloak version updated to 19.0.3, see Keycloak documentation: [https://www.keycloak.org/docs/19.0.3/server\\_admin/](https://www.keycloak.org/docs/19.0.3/server_admin/)
- Support for airgapped environments: Installing KNIME Business Hub in environments with no internet connection. Install instructions: [https://docs.knime.com/latest/business\\_hub\\_installation\\_guide/index.html#\\_introduction](https://docs.knime.com/latest/business_hub_installation_guide/index.html#_introduction)
- Embedded docker registry for custom executor images: Embedded cluster installations using kURL now contain an embedded docker registry for storing custom executor images. Documentation: [https://docs.knime.com/latest/business\\_hub\\_installation\\_guide/index.html#embedded-docker-registry-configuration](https://docs.knime.com/latest/business_hub_installation_guide/index.html#embedded-docker-registry-configuration)
- Recreate strategy for Execution contexts: For upgrading execution contexts now rolling updates and recreate strategies are both available.
- Support for custom certificate authorities

## Bugfixes

- Removed the unused ipv6 listener in the Business User Portal container, that could cause crashes in some environments

KNIME AG
